Public Summary
HCV Assessment Report
PT Raya Sawit Manunggal
Extension areas, Ketapang District,
West Kalimantan Indonesia

aidenvironment
Asia

aidenvironment

aidenvironment is an independent organization working in the field of natural resources management with vision transforming industry toward sustainability.

aidenvironment work to transform natural resources-based industry as well as their supply chains through developing awareness sustainability and raising commitment for better practice in the implementation.

aidenvironment now expand working within landscape approach with vision to restore forest and land productivity through partnership frame of management.

Date of Report	:	02 June 2017
Date of revision re-submission	:	03 December 2017
Lead Assessor	:	Haryono
ALS License	:	Provisionally Licensed Assessor (ALS15017HH)
Contact	:	Aidenvironment, Jl. Burangrang No. 18 Bogor, Indonesia, telp 0251 837 1219 email; haryono@aidenvironment.asia
Organization Commissioning the Assessment	:	PT Raya Sawit Manunggal, Jl. Melawai Raya No.10, Kebayoran Baru, Jakarta Selatan, DKI Jakarta 12160
Organization Commissioning contact person	:	Hidayat Aprilianto, Head Department Sustainability System Development and Mitigation, Bumitama Gunajaya Agro, hidayat.aprilianto@bumitama.com mobile +62 81250870599
Location	:	Matan Hilir, Sungai Melayu and Tumbang Titi Sub-Regency, Ketapang, West Kalimantan, Indonesia
Assessment Period	:	April 2016 – Mei 2017
Planned land use	:	Oil Palm Plantation
Size of Assessment (ha)	:	2,085 ha.
Legal Status of Assessment Area	:	Izin Lokasi by Ketapang District Government No. 84/PEM/2016
HCV findings	:	187.49 hectares
HCVMA	:	2,085 hectare
Certification Scheme	:	RSPO New Planting Procedure
Peer Reviewed	:	December 2016, by Dr. Kunkun Jaka Gurmaya Email Peer Reviewer : kunjgurmaya@yahoo.co.id

Abbreviation and term

AMDAL	: Analisis mengenai dampak lingkungan – Environmental and social impact assessment
ALS-HCV	: Assessor licensing scheme-high conservation value
CSR	: Corporate social responsibility
DAS	: Daerah Aliran Sungai – water catchment
SIA	: <i>Social Impact Assessment</i>
NKT/HCV	: Nilai Konservasi Tinggi/High conservation value
NPP – RSPO	: <i>New planting procedure RSPO</i>
HCV RN	: High Conservation Value Resource Network
HCVA	: High Conservation Value Area
HCVMA	: High Conservation Value Management Area
HCSA	: High Carbon Stock Approach
HGU	: Hak guna usaha
IAR	: International Animal Rescue
IBA	: Important bird area
EBA	: Endemic bird area
KBA	: Key biodiversity area
FSC	: Forest Stewardship Council
EBA – IBA	: Endemic – Important Bird Area
P&C	: Principle and Criteria
GFC	: Global Forest Change
GRTT	: Ganti Rugi Tanam Tumbuh (land compensation)
IUCN	: International Union for Conservation of Nature and Natural Resources, now World Conservation Union.
CITES	: Convention on International Trade in Endangered Species of Wild Fauna and Flora
Appendix I	: List of wildlife species that should not be traded commercially.
Appendix II	: List of wildlife species that can be traded internationally with certain quota restrictions.
Refugia	: Refuge / protection site of wildlife animal at a critical time
RTRWK/P	: District/Province spatial planning
RTE	: Rare, threatened and endangered – the protection status of species
PIR-Trans	: plantation development scheme as combination of private nucleus and plasma smallholder plantation and transmigration program.
RUSLE	: Revised universal soil loss equation
UKL – UPL	: Environmental management unit - environmental monitoring unit, part of Amdal document in the prevention of pollution and / or environmental damage.
WWF	: World Wildlife Fund for Nature.

Part 1. Introduction and background

PT Raya Sawit Manunggal (PT RSM) is the subsidiary of PT Inti Sawit Lestari (PT ISL), where PT ISL is also the subsidiary of Bumitama Agri Ltd (BGA). PT RSM is in Ketapang District, West Kalimantan. Overall the operational area of Bumitama's subsidiaries are in Riau, West Kalimantan and Central Kalimantan in total area 225,000 ha¹. Bumitama has 13 Palm Oil Mill (POM) which can produce 5.04 million-ton FFB per year. The number of mature plants areas are increasing from 21,230 ha to 143,704

Map 1. Screen shot location of Bumitama plantations and mills

ha in December 2016, the number of mature plants area has reach 82% from the total area of Bumitama Group.

Ketapang district is one of the most important area for Bumitama Group, where there are two subsidiaries manage the 14 concessions in total area 112,629 ha or 50% from all the land which is belong to Bumitama Group.

Next is the detail information of organization commissioning of this HCV assessment.

Organization Commissioning the Assessment	: PT Raya Sawit Manunggal, Jl. Melawai Raya No.10, Kebayoran Baru, Jakarta Selatan, DKI Jakarta 12160
Organization Commissioning Contact person	: Hidayat Aprilianto, Head Department of Sustainability System Development and Mitigation, Bumitama Gunajaya Agro, hidayat.aprilianto@bumitama.com mobile +62 81250870599
location	: Kecamatan Matan Hilir, Sungai Melayu dan Tumbang Titi. Kabupaten Ketapang, Kalimantan Barat, Indonesia
Planned land use	: Palm oil plantation
Assessment period	: April 2016 – Mei 2017
Size of the assessment area	: 2,085 ha.
Certification scheme	: RSPO New Planting Procedure
Legal status	: Initial license (Izin lokasi)

PT. RSM hold two type of license which are HGU 4,034 hectar and Izin Lokasi 2,085 hectar as the extension of HGU area. Both of the licence occupying former PIR Trans project which was under PT Bangun Maya Indah license as one of subsidiary of PT. Benua Indah Group (PT. BIG). In this situation planning project development of PT RSM occupied brownfield areas. Furhter when the HCV assessment start the operational for both license areas of PT. RSM still not yet commenced. Areas licence of Izin Lokasi as extension areas of HGU defined as the target of this HCV assessment since HGU area is not eligible to follow NPP scheme. The HGU areas of PT. RSM replacing previous HGU of PT BMI where the plantation actively manage until the ownership transfer to PT. RSM.

¹ http://www.bumitama-agri.com/asset/upload/storage/report/Bumitama_Agri_AR2016.pdf

a. Objective of HCV assessment

- b. To identify the presence, potential presence or the absence of the HCVs within the assessment area.
- c. To develop HCV management and monitoring plan document for ensure future the plantation development activities not adversely effect on HCVs
- d. To comply with RSPO NPP procedure

e. HCV Guidance and Reference

Indonesian toolkit for the identification high conservation values, 2008 used as the main guidance, where the Common guidance for the identification of High Conservation Values, HCV Resource Network 2013 used as the secondary guidance of this HCV assessment. Several others HCV guidance are used in this assessment such as the HCV assessment manual, *HCV Resource Network ALS, 2014* and Common guidance for the management and monitoring of HCV, *HCVRN 2014*. The next following are the definition of the 6 HCV in between the toolkits.

Table 1. The 6 categories of HCV

Toolkit for identification high conservation values in Indonesia, 2008	Common guidance for the identification of High Conservation Values, HCV Resource Network, 2013
HCV 1 Areas with Important Levels of Biodiversity	HCV 1 Species diversity
<ul style="list-style-type: none"> 1.1 Areas that Contain or Provide Biodiversity Support Function to Protection or Conservation Areas 1.2 Critically Endangered Species 1.3 Areas that Contain Habitat for Viable Populations of Endangered, Restricted Range or Protected Species 1.4 Areas that Contain Habitat of Temporary Use by Species or Congregations of Species 	Concentrations of biological diversity including endemic species, and rare, threatened or endangered species, that are significant at global, regional or national levels
HCV 2 Natural Landscapes & Dynamics	HCV 2 Landscape-level ecosystems, ecosystem mosaics and IFL.
<ul style="list-style-type: none"> 2.1 Large Natural Landscapes with Capacity to Maintain Natural Ecological Processes and Dynamics 2.2 Areas that Contain Two or More Contiguous Ecosystems 2.3 Areas that Contain Representative Populations of Most Naturally Occurring Species 	Large landscape-level ecosystems and ecosystem mosaics that are significant at global, regional or national levels, and that contain viable populations of the great majority of the naturally occurring species in natural patterns of distribution and abundance.
HCV 3 Rare or Endangered Ecosystems	HCV 3 Ecosystems and habitats
	Rare, threatened, or endangered ecosystems, habitats or refugia.
HCV 4 Environmental Services	HCV 4 Ecosystem services
<ul style="list-style-type: none"> 4.1 Areas or Ecosystems Important for the Provision of Water and Prevention of Floods for Downstream communities 4.2 Areas Important for the Prevention of Erosion and Sedimentation 4.3 Areas that Function as Natural Barriers to the Spread of Forest or Ground Fire 	Basic ecosystem services in critical situations, including protection of water catchments and control of erosion of vulnerable soil and slopes

HCV 5 Natural Areas Critical for Meeting the Basic Needs of Local People	HCV 5 Community needs
Basic needs are defined as: a. Food, b. Water, c. Clothing, d. Materials for building and tools, e. Firewood, f. Medicines, g. Fodder for livestock	Sites and resources fundamental for satisfying the basic necessities of local communities or indigenous peoples (for livelihoods, health, nutrition, water, etc.), identified through engagement with these communities or indigenous peoples.
HCV 6 Areas Critical for Maintaining the Cultural Identity of Local Communities	HCV 6 Cultural values
	Sites, resources, habitats and landscapes of global or national cultural, archaeological or historical significance, and/or of critical cultural, ecological, economic or religious/sacred importance for the traditional cultures of local communities or indigenous peoples, identified through engagement with these local communities or indigenous peoples.

Other references used in this study include forms of secondary data and thematic maps related to the study area and its wider landscape, among others; land cover, soil type, slopes, ecosystems, distribution of rare, threatened and endangered species (RTE) and socio-cultural data related to the landscape. The reference data analyzed on early stage of the assessment to be able to estimate the opportunity of HCVs presence in the concession area or in the wider landscape, further the outcome will be determining the method of the HCV assessment field assessment.

Part 2. Description of assessment area

PT Raya Sawit Manunggal is located in between coordinates 110°23'55.73" - 110°32'24.65 East and 1°50'35.57" - 1°55'21.25 South. Other concession on immediate boundaries of PT RSM are PT. Artu Borneo Plantation (PT. ABP – Eaglehigh group) on the south and west and PT. Sentosa Prima Agro (PT SPA - BGA group) on the north. The land use status of PT.RSM concession is fall into APL (*Area Penggunaan lain*) land status or non-forestland area. The APL status is an areas allocated for development for infrastructure, agriculture and plantation which outside of forestry scheme development, in this case the development planning of oil palm plantations by PT RSM can be done in those area.

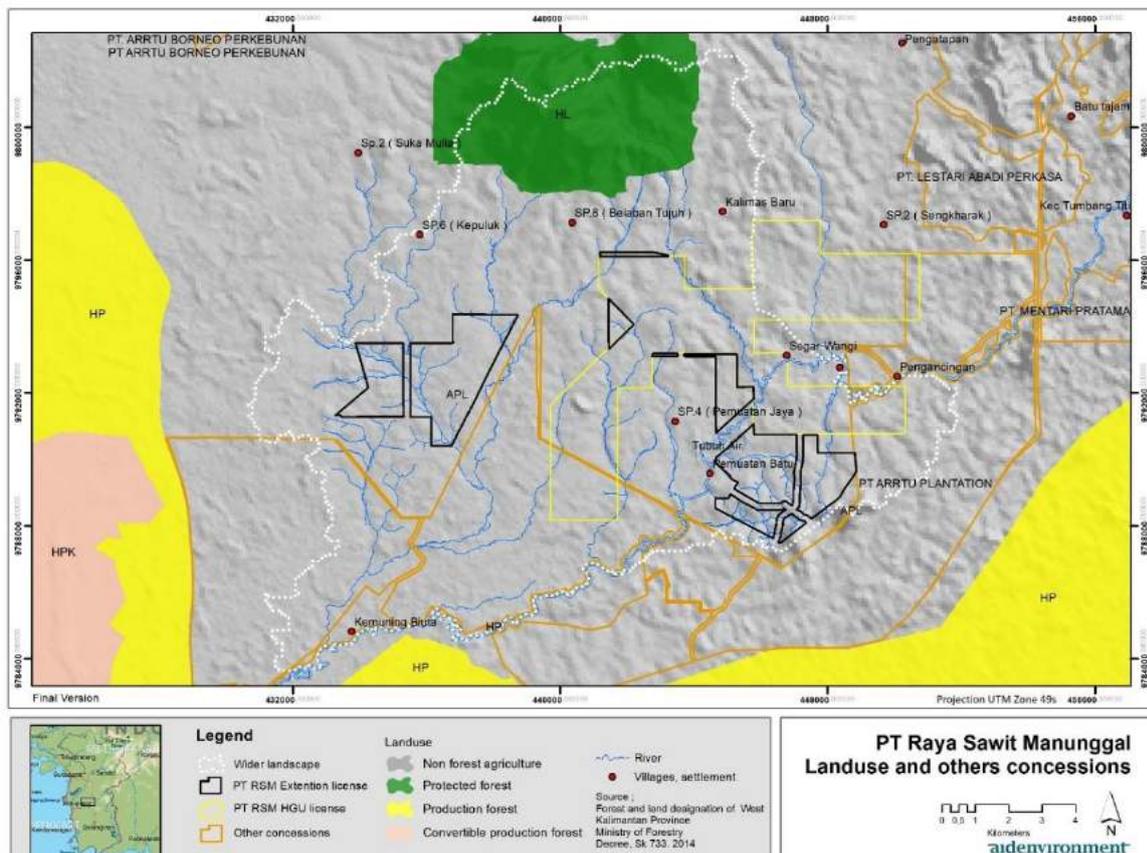

The legal status of the study area is “*izin lokasi*” in total area of 2,085 ha, this location is the extension area of prior PT. RSM HGU of 4,034 ha. The history of Izin Lokasi of PT. RSM start when was PT. RSM winning the auction process of HGU of 4,034 hectares in April 2015. The HGU area prior to acquisition by Bumitama is the area of HGU from PT Bangun Maya Indah (PT BMI) subsidiary of PT Benua Indah Group (PT.BIG), whereby PT. BMI in 2009 was declared bankrupt by the Indonesian Court. As the HGU obtained consider not prospective from palm oil plantation business where contain old not productive trees, Bumitama proposed extension areas to Ketapang district government. On February 10, 2016 Ketapang district government award Bumitama with extension areas with Location Permit license (*Izin lokasi*) of 2,085 ha through the district decree number 84/PEM/2016. This extension license area is subject to this HCV assessment as Bumitama targeted this as new planting for PT.RSM, since all HGU consider as replanting areas and not classified as new planting.

The land use history of the landscape surrounding of the study area is the location of several logging companies (HPH) in the 1970-1980 era and in the 1990s the oil palm plantation development program was initiated through the PIR-Trans scheme by the government in partnership with PT Benua Indah Group with several subsidiaries

Map 2. Location of PT RSM

Map 3. Land use surrounding PT RSM landscape

Overview area concession and its landscape features on the pre-assessment stage will decide the need of certain expertise of HCV assessment team. The HCV assessment team is arranged based on the highest opportunity of HCVs within a precautionary approach. HCV assessment team is arranged from biodiversity experts on landscape ecology, environmental services, flora, fauna, socio-culture, GIS and mapping. List of the HCV assessment team members can be found in the attachment of the report.

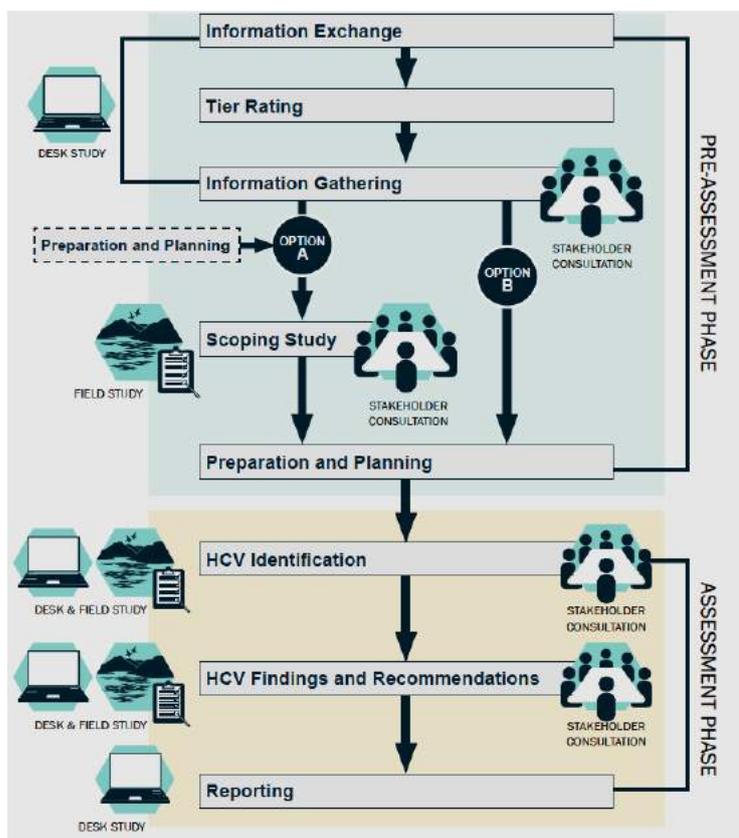

Table 3. HCV assessment team members

Name	ALS License	Role	Expertise
Haryono Haryono@aidenvironment.asia	Provisional ALS15017HH	Team leader	Forest and landscape ecology, hydrology & Ecosystem services, PRA & Participatory mapping, GIS analysis
Ivan Valentina Ivan@aidenvironment.asia	N/a	Team member Social team leader	Legal and social economy
Muzva Dharma dharma@aidenvironment.asia	N/a	Social team member	Social economy, Rural development and PRA
Eka Kurnia eka_man22@yahoo.co.id	N/a	Team member Biodiversity team leader	Botany, forest inventory dan GIS analysis
Salman Salman@aidenvironment.asia	N/a	Biodiversity team member on Environmental service	Social forestry, Hydrology dan GIS analysis.
Berman Manurung Berman.manurung@gmail.com	N/a	Biodiversity team member on Wildlife survey	Wildlife ecology dan survey
Ignatius Ignasiussuriyanto422@gmail.com	N/a	Biodiversity team member on plant survey	Botanist and forest inventory

Part 3. Step and methods

Generally, there are two main steps on the HCV assessment, which divided into pre-assessment and the field assessment, these steps follow the assessment step in common guidance for the identification of High Conservation Values. HCV Resource Network. 2013

Image 1. The step of HCV assessment

Source; HCV RN, Common guidance for Identification of High Conservation Value, September 2013

a. Timeline of HCV assessment

Table 4. Timeline of PT RSM HCV assessment

Step	Program	Dates
Pre-assessment	Landscape analysis Watershed analysis Status development analysis Social survey design Species and landscape ecology survey design.	April 11- 22, 2016
Field scoping study	Land use and landcover verification Slope and topographic verification	April 19, 2016
	FGD on 3 villages Kemuning Biutak, Segar wangi dan Sungai Melayu	April 20, 2016
	Initial public consultation	May 4, 2016
Field assessment 1	Plant and wildlife survey Social survey	April 20 – May 3, 2016

	Consultation with PT. RSM management	December, 2016
Peer review	Peer review	December, 2016
Field assessment 2	2nd plant survey	April 18-20, 2017
	Public consultation on 3 villages Kemuning Biutak dan Sungai Melayu Segar Wangi	April 20, 2017 April 21, 2017
Report finalization and review process to HCVRN	Review by HCV RN	Juni, 2017
Report revision resubmission to HCV RN	Report revision submission for review	November, 2017

b. Pre assessment and scoping

In the pre-assessment stage, secondary data analysis related to the study area is related to the purpose and objective of HCV assessment, followed by tier-rating related to the scale, intensity of the development project plan and the risk level both within and around the study area. Secondary data are the data related to basic information. The land use and series of satellite image used to identify status of the assessment areas which may fall into *greenfield* or *brownfield* and to assess the compliance of the assessment areas with the NPP RSPO scheme as the main objective of this HCV assessment. Scoping field of study was done at the end of this pre-assessment stage in the form of field verification and clarification related to the outcome of secondary data analysis. The momentum of field scoping studies was optimized to convey the understanding of HCVs to the local stakeholder as well as to get input, expectations, problem and threats form relate to the HCV and project planning development of PT RSM.

c. Landcover update

The updated of land cover data in the HCV assessment is crucial regarding areas with high possible finding of HCVs which including the biodiversity concentration, environmental service and socio-cultural. In this study, High Carbon Stock approach (HCSA) methodology used to determine the different classes of land cover including degraded lands. The land cover class in the HCS approach is structured based on its carbon content, the density forest class divided into 4 sub-classes; high, medium, low density forest (HDF, MDF, LDF) and young regeneration forest (YRF). In addition, this approach also identifies the degraded land cover which not classified as HCS forest such as open land, shrubs, farmland, plantations, roads, settlements and others.

Image 2. The illustration of HCS approach landcover

Sources; HCS Approach toolkit Versi 1 Agustus 2015

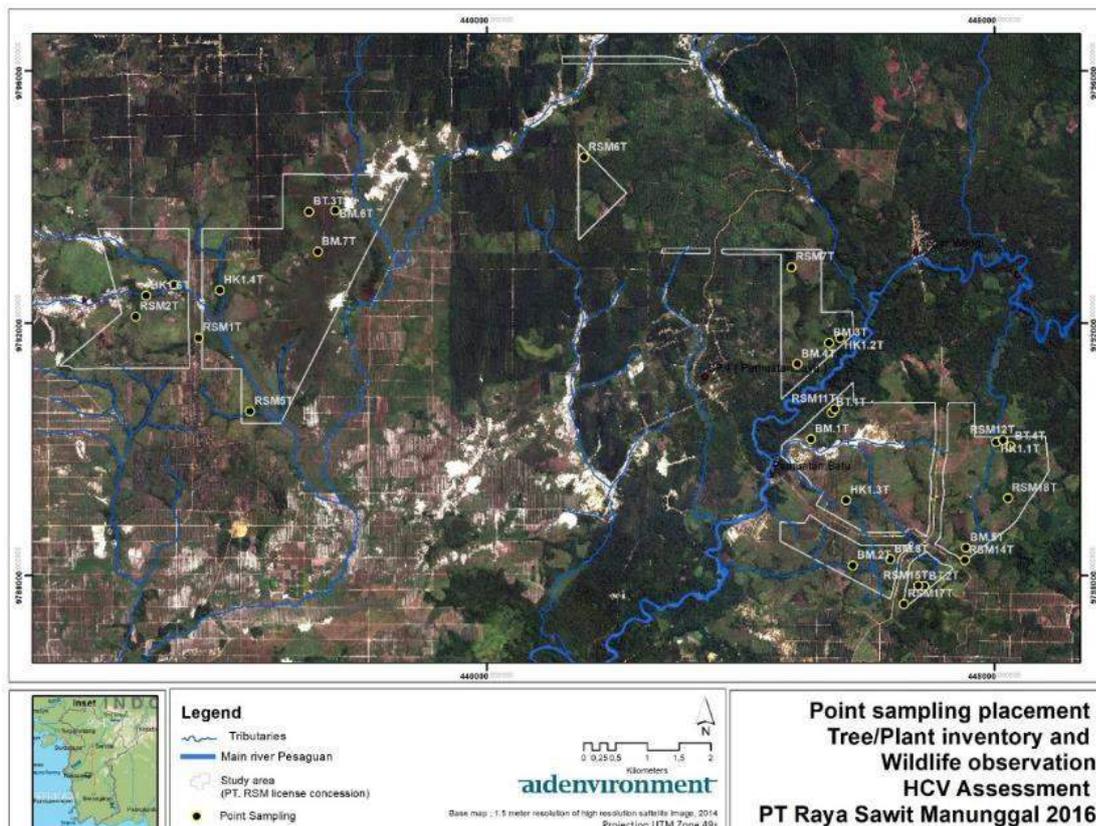

d. Vegetation – plant species sampling

Vegetation-plant sampling is conducted to find out the existence of the HCV plant species. The sampling vegetation result will be used to refine the land cover data from the initial stratification which was conducted during the pre-assessment phase. The initial interpretation of the land cover will guide the method of vegetation sampling plot placement. Stratified random sampling method was chosen regarding the result of initial stratification informing the vegetation condition already heavily degraded and fragmented. The first stage of stratified random sampling is to select the areas that have the highest opportunity of HCV of plant species for being discovered, regarding the habitat quality observed on the class of the initial land cover, the second stage is to spread the sampling points evenly across all the areas specified in the first stage. Vegetation-plant sampling points are constructed in a form of 25 x 25 meters square main plot and a sub plot is 5 x 5 meters. In plots 25m x 25m all trees with diameters greater than 15cm are recorded. In plots 5m x 5m all trees with diameters in between 5cm - 15cm are recorded while also recording other non-trees plant species.

e. Wildlife observation

Wildlife observation is conducted visually for the presence of traces on the ground as well as their traces on vegetation and the sounds of wildlife species. From the landscape analysis regarding the potential population distribution of wildlife, the most probability of wildlife occurrence in the landscape are species of mammals, primates, birds, and reptiles. Due to the habitat condition in the landscape which is already fragmented in some small patches, it is not possible to implement the line transect method of wildlife observation. The observation of wildlife is conducted by the point count method. The point observation is conducted at the same location with the vegetation-plant point sampling.

Map 4. Vegetation-plant sampling plot together with point of wildlife observation

on confirming the dubious information outcome from FGD and participatory mapping to the several respondent. The interview in specific number of respondents were not conducted in this HCV assessment. The social survey location conduct is in three native villages; Sungai Melayu village, Kemuning Biutak village and Segar Wangi village and in the SP transmigration village.

Consultation method for the public consultation were interview, participatory mapping, FGD (Focus Group Discussion) and seminar. The Interview method, participatory mapping and FGD held when the field assessment is conducted. The workshop seminar method was held when scooping study from the result of pre-assessment and during final consultation of this study with presenting data analysis result, HCV findings and HCV management recommendation.

h. Threat assessment

The assessment conducted in qualitative threat assessment method, the threat data recorded in each steps of HCV assessment. The other purpose of the qualitative threat assessment is to be developing the qualitative analysis which will give general level of threat indication which might be happen in to an HCV. The threat measured and recorded based on its probability and the impact level consequences to a HCV. The other purpose of this threat assessment is to propose proper recommendation into management on how to mitigate and recover the HCVs impacted from the threat.

The qualitative threat analysis can also make use of quantitative data in which result from the threat observation estimation, prediction, conclusion, or suspected to be limited. Result of the analysis depend on the knowledge, experience, and the intuition of the expert for identifying, assessing, and proposing the proper management. In the process of threat assessment, all the relevant data collected. The propose recommendation on management and monitoring of the threat will be based on the available information, expert judgement needed if the specific knowledge of the HCVs are not available.

i. Outline method of the 6 HCV component

Assessment method of HCV in PT RSM are following the Indonesia HCV Toolkit, 2008. Here is the resume of the HCV Assessment method that been used along the assessment.

HCV 1. Areas that contain or provide biodiversity support function to protection or conservation areas

HCV 1.1. To verify the presence or absence of functions of area that have an impact on the conservation status of biodiversity within a protected or conservation area.

HCV 1.2 The purpose of HCV 1.2 is to identify Critically Endangered species (CR-IUCN) that are present in a MU or nearby and likely to be affected by off-site impacts of the MU. Management action must be undertaken by the MU to protect each individual of such species.

HCV 1.3 HCV 1.3 Aims to identify habitat in or near a MU whose protection is required for maintaining viable populations of endangered, restricted range or protected species. Populations of species that must be considered in HCV 1.3 include all species identified under;

- Endangered or vulnerable in red list of IUCN
- restricted range species
- protected by the Indonesian government through law number 5 1999 and other laws and regulations below
- CITES Appendix 1 and 2 .

HCV 1.4 The purpose of HCV 1.4 is to identify keystone habitats in a landscape used temporarily by groups of individuals or species.

HCV 2 Natural landscape and Dynamics

HCV 2.1 This HCV aims to identify and protect areas of a natural landscape where natural ecosystem processes occur and have the potential to persist for the long-term. The key to achieving this is the identification and protection of core area(s) within a landscape, which are essential for guaranteeing the continuation of ecological processes unperturbed by edge effects and fragmentation.

HCV 2.2 Areas supporting a diversity of ecosystems support great numbers of species and have high capacity to sustain them for the long term.

HCV 2.3 The persistence of a species in the long-term requires maintaining habitat of sufficient quality and extent for population viability. Although the area of habitat required to maintain a viable population varies greatly among species, it is a fact that large, unfragmented areas with a diversity of ecosystem types have higher potential to sustain a variety of species in the long term than areas that are small, fragmented and with few ecosystem types.

HCV 3 Rare and Endangered Ecosystem

HCV 3 The objective of HCV 3 is to identify and delineate ecosystems within a landscape.

HCV 4 Areas or important ecosystem

HCV. 4.1. The purpose of HCV 4.1 is to identify areas important for the protection of hydrological function and maintenance of a watershed. It is intended to protect both the quantity and quality of water

HCV 4.2 The purpose of HCV 4.2 is to identify areas important for the protection of hydrological function and maintenance of a watershed. It is intended to protect areas important to prevent erosion. The area of HCV 4.2 exists where forests or other vegetation are in good condition grown on areas with potentially serious Danger Erosion Level. Areas with potentially heavy TBE are defined as areas expected to experience erosion rates of 180 t / ha / yr. or more if vegetation cover is cut down.

NKT 4.3 The purpose of HCV 4.3 is to identify areas that act as natural barriers to prevent the spread of forest and land fires.

NKT 5 HCV 5 aims to determine areas that have an important function as a source of livelihood for local communities, either to meet the needs directly (subsistence / self-consumption) or indirectly (commercially), that is by selling products (forest products or other natural resources) to get cash for fulfilling basic needs include; a. Food, b. Water, c. Clothing, d. Materials for home and appliances, e. Firewood, f. traditional-herbal medicine, g. Feed the livestock.

NKT 6. Areas that have an important function for the traditional cultural identity of the local community, where the area is needed to meet their cultural needs. The interconnectedness of the community to the region is manifested by the ideas, ideas, norms, values, activities and patterns of action, and the environment / natural resources / things, underlying the collective behavior of community members and communities with the region.

Part 4. Findings

a. Regional – National Context

PT RSM landscape falls into WWF's Borneo Lowland Rain Forests ecoregion (Olson, et al. 2001). WWF considers this ecoregion is a global conservation priority due its exceptional wealth of biodiversity, carbon sequestration, and high levels of threat linked to logging, habitat conversion, forest fire, and hunting. Deforestation is an ongoing threat to regional biodiversity, Borneo suffering extensive forest loss in recent decades. There has been a marked significant reduction of forest extends in Borneo over the past 30 years. In PT RSM landscape forest fragmentation start in 1985 and the significant forest loss start in 1990. The map of Borneo wide landscape Orangutan population distribution by IUCN habitat indicated overlaps with landscape study, as well as map from Borneo-wide Population Habitat Viability Analysis – PHVA (FORINA, et al 2017). There is no overlap indication with GRASP (Singeton et al, 2004). Landscape land cover analysis and orangutan habitat distribution found the closest Orangutan on 15 km to the west on area of peat forest block of Pematang Gadung.

There is no overlaps indication on the landscape assessment with Important bird habitat (IBA dan EBA) (Birdlife Internasional, 2004), there are two Important Bird Areas (IBA) in West Kalimantan - IBA Gunung Palung National Park and Muara Kendawangan Nature Reserve and both located more than 60 km from location site. Both IBAs are part of Key Biodiversity Areas (KBA) which nationally identified as global significance sites. Ramsar Sites in the West Kalimantan located at Danau Sentarum and Tanjung Puting National Park, which are far from the assessment site.

Landscape overlay analysis found the potential present indication of several Borneo endangered species in the landscape study such as *Pongo pygmaeus*, *Manis javanica*, *Presbitis chrysomelas* dan *Rhinoplax vigil* and other species like *Nasalis lavartus*, *Helartos malayanus*. The number of plant species in Borneo including timber and non-timber are estimated 10.000-12.000 plant species (T.C whitmore, 1973). Specifically for timber trees spesies, the number reaches 2,676 species where 267 species are species from family of Dipterocarpaceae where 155 (60%) species of them are endemic species, so the Borneo island is home for Dipterocarpaceae family species in the world. The high rate of deforestation impacted to conservation status of several dipterocarps family species in Borneo such as *Shorea pachyphylla*, *Parashorea lucida*, *Shorea seminis* and *Shorea balangeran*

In Ketapang district landscape there are several important areas in which represent biodiversity of Borneo island including key biodiversity areas; 1). Sub-montane and montane forest as catchment area of most river in Ketapang landscape, 2). Peat and peat forest as part of coastal swamp areas, 3) Gunung Palung National Park (KBA, IBA & EBA), 4) Muara Kendawangan nature reserve (IBA). 5) Heath forest ecosystem, 5) Mangrove forest ecosystem. The intact forest landscapes (IFL) in Borneo is in the mountainous part of the central island of Borneo. The Ketapang district landscape is still part of this intact forest landscape (IFL) in the north-east. While the landscape study indicated no overlap with the intact forest landscape (IFL).

Ecosystem mapping analysis on landscape found that the landscape study falls into Borneo *bio-physiographic southern plain and mountain*. Those bio-physiographic structured of 16 ecosystem types from 3 elevation zones. 11 ecosystem types found on the lowland forest zone (below 500 meters), 3 ecosystem types in sub-montane forest zone (below 1000) and 2 ecosystem types in the montane forest zone (more than 1000 meters). The landscape study (PT RSM landscape) are related to 3 types of lowland forest ecosystems which are, Lowland dipterocarp forest on basalt, Lowland

dipterocarp forest on Granite and Heath forest ecosystems. The next following are all the 16 ecosystem types found in *the Borneo bio-physiographic southern plain and mountain*.

1. Low land forest ecosystem;

Fresh water swamp, Peat swamp, Heath forest, Riverine forest, Mangrove and tidal swamp, Lowland dipterocarp forest on sandstone, Lowland dipterocarp forest on basalt, Lowland dipterocarp forest on Granit, Lowland dipterocarp forest on metamorphic rock, Lowland dipterocarp forest on volcanic rock, Lowland dipterocarp forest on marine sediment

2. Sub-montane forest ecosystem;

Sub-montane forest on indigenous Granit, Sub-montane forest on metamorphic rock, Sub-montane forest on heath forest

3. Montane forest ecosystem;

Montane forest on indigenous Granit, Montane forest on metamorphic rock.

PT. RSM landscape is located in the middle of Pesaguan watershed and Pesaguan river dividing the PT RSM concession block into north and south block. Upstream part of Pesaguan watershed is a hilly area with 800 meters ASL as the highest point, and on the upstream part remain some portion of primary forest. The middle part is a combination of undulating and hilly terrain (as part of southern plain and mountain) with very low forest cover remaining. The downstream part is coastal peat swampland (coastal swampland). Intact forest blocks on the Pesaguan catchment are located on the upstream part with direct distance 50 km from landscape sites. Downstream of the watershed is a peat forest ecosystem with direct distance of 20 km. Upstream zone of watershed occupies 22% of the total watershed area, while the middle 28% and the downstream section is 60%. The land cover analysis of Pesaguan watershed found the natural land cover on the upstream catchment area remain 51%, middle part as the most critical remain 0.01% of natural land cover and the downstream area are still considered fair with 27% of natural forest cover within peat forest ecosystem.

b. Wider landscape context

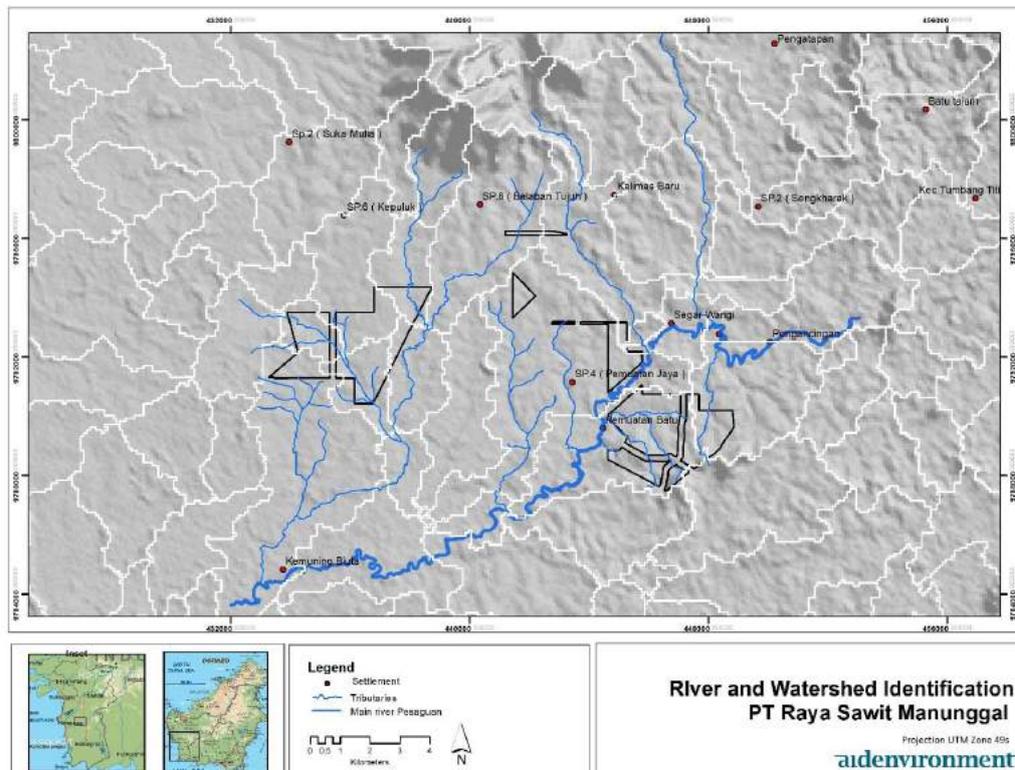

Landscape is defined as a geographic mosaic composed of interacting ecosystems as the effect of geological, topographic, soil, climatic, biotic and human interactions on a particular region (IUCN)². The published 'landscape' definition can be implemented in varying extents from less than one hectare to over 200,000 hectares. Borneo Island itself can be referred to as a landscape on study on a regional scale. For smaller areas of study may use ecological boundaries that cover the entire concession area and the its outer association areas.

The landscape study (wider landscape) is a wider area than area concession itself where there is a form of ecological and or social association occur in between areas concession and it wider landscape area, it also can be interpreted as potential impacted areas from from the project planning development regard with environmental and social aspect. This study makes use of watershed approach on defining wider landscape, where several sub watersheds identifies in which areas concession of PT RSM as part of it. The sub watershed identified is part of the Pesaguan watershed as the main watershed in the landscape. The sub watershed identifies through the identification of the rivers network on high resolution satellite image and find out the coverage of sub watershed in which connected to the area concession. Further the digital elevation data (SRTM) optimized to build the digital model of river network and its sub watershed. Final step on visual verification conducted on high-resolution satellite imagery (resolution 1.5 meters) to refine the results from both visual and the

² <https://portals.iucn.org/library/efiles/documents/fr-021.pdf>

digital model. The next following describes the process of identifying river network and sub watershed through digital model (SRTM) and how the areas of sub watershed connected to the area concession.

Map 5. River network and sub watershed identification process

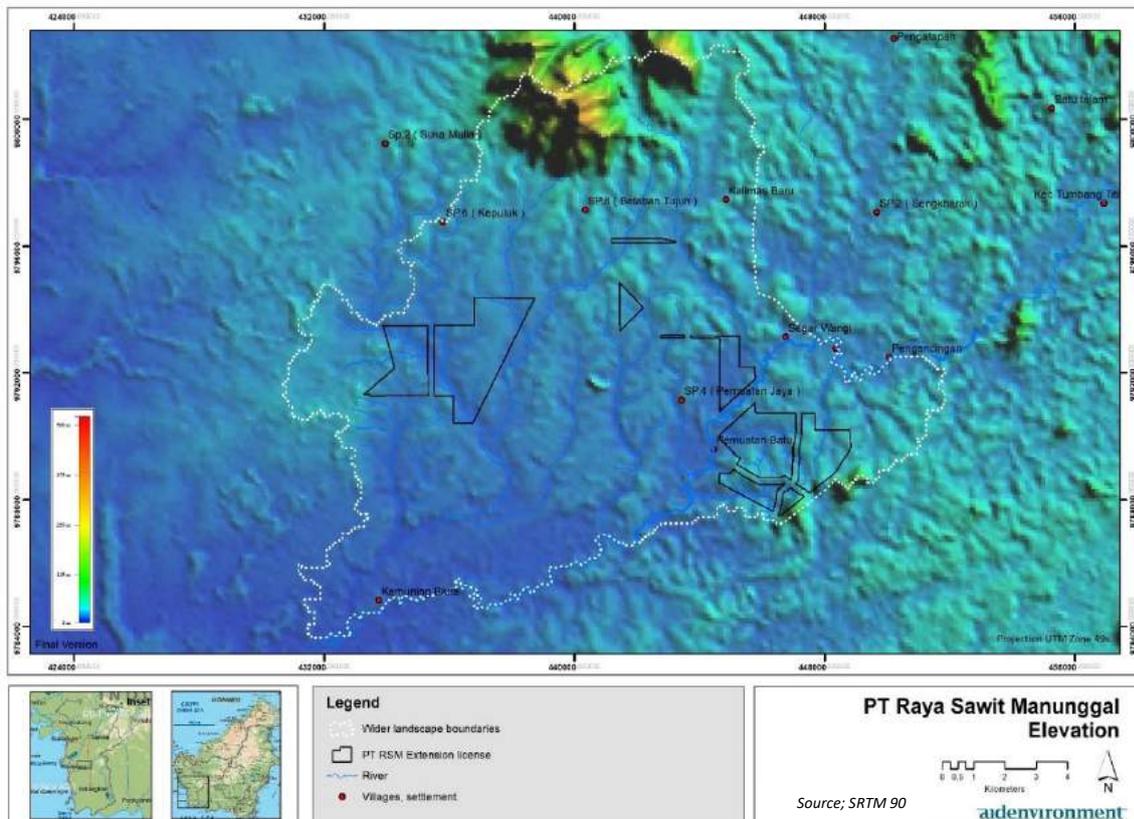

Climate type on the landscape fall to type A follow climate system classification of Schmidt and Ferguson in 1951, with value of $Q = 0.4$, the rainfall ranges from 2,761 mm/year. Wet months with rain of ($> 100\text{mm}/\text{month}$) which is the rainy season almost all year long, while dry months are not with rain below 60 mm /month. The average air temperature of the year ranges from 26 - 28 ° C, the average air humidity 85% - 95%³. According to SRTM the elevation of the area concession is about 18- 94 m above the sea level, the highest area is in the southern of the concession. Most of the concession is at a slope below 8%. There is a slope rate above 25% in the highest hill area of the southern.

The landform and the soil characteristic on PT RSM landscape is *undulating rolling plains* (in Rangankau Unit), *hillocky plains* (in Honja unit) and *Non-oriented - sedimentary hills* (Pakalunai unit). (Repprott 1987). In general landform and soil types in PT RSM landscape are :

1. Tropudult, Paleudult and Tropaqueps, are part of Ragankau (RGK) land unit (Repprott landsystem unit). The area description is a rolling with wide valleys, lithology is come from *Andesite, Basalt, Granit Scheist and Recent alluvium* (on the river border). This area is classified as suitable (S) for palm oil.
2. Tropudult and haplorthox, as a part of Pakalunai – PLN land unit (Repprott landsystem unit). The area description as *Non-oriented - sedimentary hills*, lithologi is come from *Granite, schist, andesite, basalt and granodiorite*. This area is defined as unsuitable (N) for palm oil.

³ Hasil pengamatan stasiun pengamatan cuaca PT. Suka Jaya Makmur, Stasiun berada pada arah barat daya jarak lurus 60 km.

3. Tropudult, Paleudult, trophulmuts, as a part of Honja – HJA land unit (Repprott landsystem unit). The area description is *hillocky plain* or hilly terrain, lithologi is come from *Andesite, basalt, granodiorite; schist; granite*. This area is defined suitable (S) for palm oil.

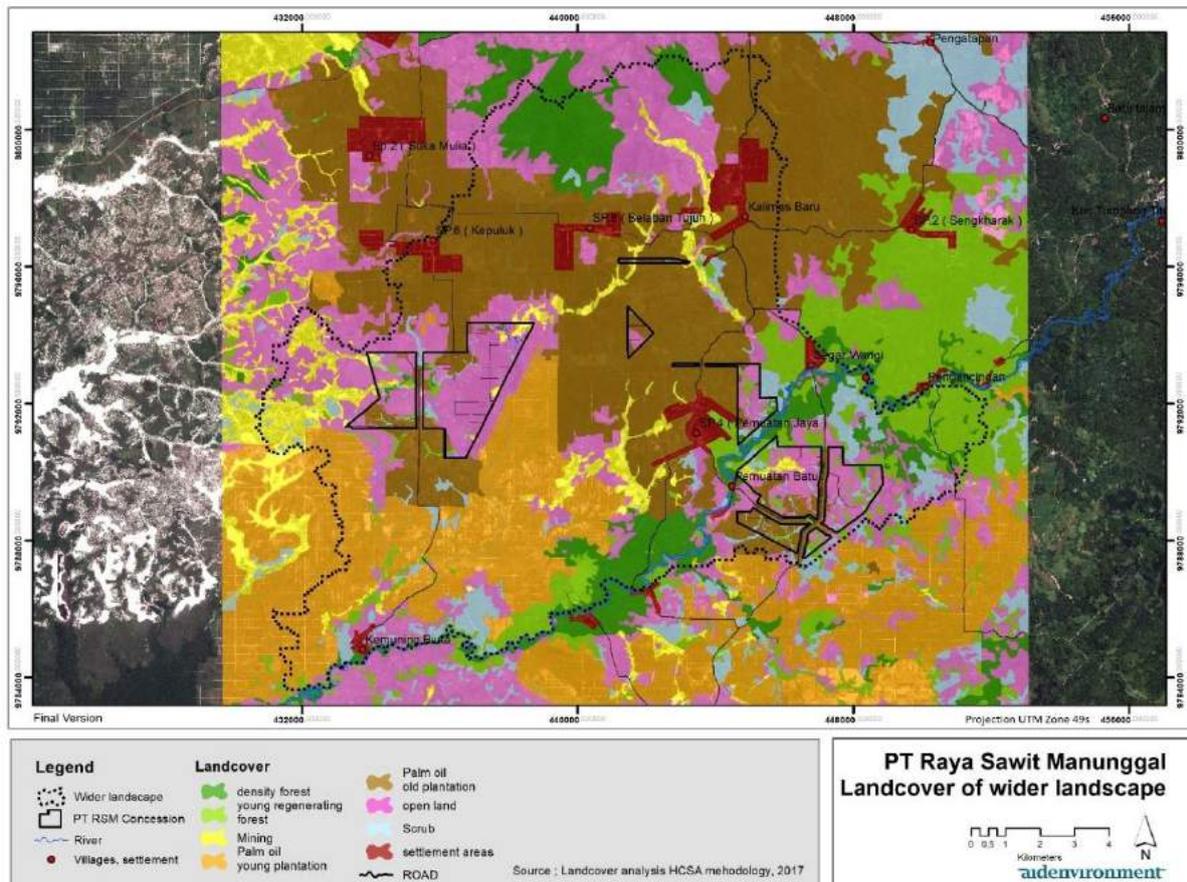

Map 6. Elevation on the landscape study

Landscape landcover dominated by old and young palm oil plantation, old plantation came from previous PIR trans project and new young plantation mostly areas plantation of PT. Artu Borneo. Scrub and open land are also significant in the landsape, while natural vegetation still remaining on Bukit Belaban tujuh-Bukit Keseduk on the north and also remain along Pesaguan river buffer. There is ex-gold mining which connected to the wider ex-gold mining areas outside the landscape to the west. The landcover in area concession has been heavily degraded and fragmented. Landcover proportion in the concession area consist of open land and scrubland (63%) and palm oil (20%). There is a small part of the community garden in the form of a rubber plantation (2.7%), fragmented natural vegetation found in rivers buffers (6.6%), ex-mining areas are also significant in the area (5%).

The area blocks concession is divided into 6 blocks to the north and 4 blocks on the south of Pesaguan river. The main land formation of the wider landscape is Plain and there is a small portion of the area that falls into the Hill category. The land use status is non-forest area (APL) which dominated on the landscape include area concession, there are also the important area for the biodiversity which is located on the protected forest area (HL) of Bukit Belaban Tujuh with highest elevation, and slope levels in the landscape and still have natural land cover. Other area which has support function for biodiversity in the landscape is on river buffer of Pesaguan river with the high-density forest remaining as community agroforestry where the vegetation in the area is still in combination with the trees of natural species. Bukit Belaban Tujuh is a catchment area of two rivers which is flowing down to the south through the area concession and end to the Pesaguan river.

Map 7. Landcover condition on wider landscape and area concession

Landscape analysis found that the endangered and critically endangered mammal species which listed on the IUCN red list are still potentially to be found in the landscape, the analysis found the landscape are part of the distribution population of endangered mammal species such as *Pongo pigmaeus*, Beruang madu *Helarctos malayanus*, Trenggiling *Manis javanica*, Bekantan *Nasalis lavartus* dan species burung Enggan Gading *Rhinoplax vigil*.

In the demographic and socioeconomic aspects of the wider landscape there are several settlements. The settlement is a combination of native villages and transmigration villages from the PIR trans project which started in 1992. The native villages are Sungai Melayu, Kemuning Biutak and Segar Wangi Village. While the transmigration villages are SP.6 Kepuluk, SP.8 Belaban Tujuh, Kalimas Baru Village, and SP4-Pemuatan jaya village.

Table 6. Demographic of the native villages in the landscape, BPS 2016

Villages	Sub district	Extend Km ²	Population	Sex		Families	Density/ KM
				L	P		
Kemuning Biutak	Matan Hilir selatan	212	3319	1695	1624	1022	7
Segar Wangi	Tumbang Titi	60	1760	914	846	681	29

16	Mekar Jaya (SP4)	Sei Melayu Rayak	DSN	SPA	342	855
Total					7.115	17.902

The ethnicity composition of native villages within the landscape has increased in line with the presence of transmigrants from the Trans PIR project since the 1990s and along with gold mining activities that began in the 2000s which also brought in workers from outside of the landscape. The ethnic of transmigrant are the Javanese and Sunda and the miners are from the other areas in West Kalimantan.

Table 8. The ethnicity and religion of the native villages on the landscape

Villages	Ethnicity	Religion	%*
Kemuning Biutak	Dayak	Protestant dan Catholic	90%
Segar Wangi	Melayu	Islam	70%
	Dayak	Kristen Protestant dan Catholic	30%
Sungai Melayu	Dayak	Kristen Protestant dan Catholic	50%
	Melayu	Islam	35%
	Jawa	Islam	15%

* 2014 data

The poverty rate of the villagers in the study villages based on the Central Bureau of Statistics data is measured by the level of the family welfare (Pra-KS and KS-1) and the abandoned population (elderly dan children) and beneficiaries of rice subsidy, as follows;

Table 9. The poverty figures of native villages in the landscape

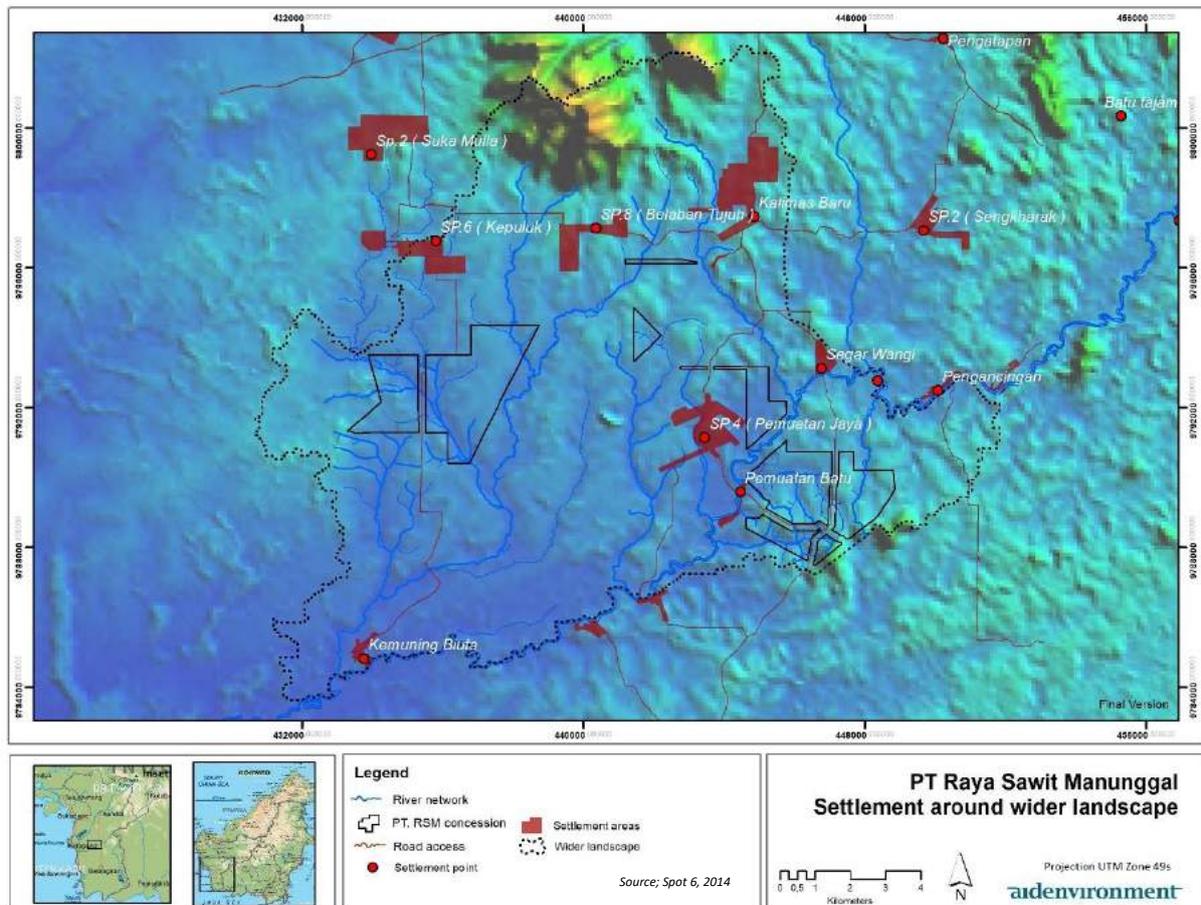

Villages	Pra-KS	KS-I	Total	Percentage from total family
Kemuning Biutak	-	220	220	21,52 %
Segar Wangi	20	22	44	6,46 %
Sungai Melayu	-	110	110	23,70 %

Table 10. The abandon-homeless figure from native villages in the landscape

Villages	Elderly	Children	Total	Percentage from total population	Ras-Kin* beneficiaries
Kemuning Biutak	108	514	622	36,69 %	160
Segar Wangi	105	390	495	28,12%	106
Sungai Melayu	125	617	742	31,69%	83

*Government rice subsidy for poor people.

Map 8. Villages and settlement distribution in the landscape

The economics history in the landscape starts with timber companies around 1970s to 1990s. Some timber companies operated among them PT. Wood Pesaguan, PT. Mohairson, PT. Suka Jaya Makmur and PT. Inhutani II. The development of oil palm plantations in the landscape under the PIR Trans scheme starting on early of 1990's. Together with the java transmigrant, local communities were also prioritized to participate in the project. The project implementer is PT. Benua Indah Group (PT BIG). At the beginning of the PIR Trans project the economy of local community and transmigrants improved, unfortunately starting in 2005 there was serious miss management of PT. Benua Indah Group (PT BIG) and the communities cannot sell FFB since there was no other palm oil mill surrounding the landscape on that time. Further operational activities of PT. BIG totally closed by September 2009.

From the accessibility aspect all the villages in the landscape study has road access started since PIR trans project in 1990s which open the access for most of the landscape area. Sungai Melayu village is in Kota Kecamatan Sungai Melayu Rayak with most good accessibility on the main axis road of Pontianak - Nanga Tayap - Ketapang. The other two villages are in the southern part of the concession area with access through old plantation roads and transmigration settlement sites. On dry conditions to access Kemuning Biutak Village is around in 1.5 hours and Segar Wangi village within 1 hour from the main axis road which is on Sungai Melayu. From the accessibility aspect and location, Sungai Melayu has higher ethnicity composition compared to the other 2 native villages.

Basic economics of the local community both Malay and Dayak people are on the traditional agricultural, especially shifting cultivation to get rice as the main crops which mix with corn and vegetables. Rubber is a cash commodity in which is part of the culture from previous generation. Rubber plantation mostly in a form of jungle rubber which mix with the native trees. Several

community members now start to plant clonal rubber varieties in replacing their shifting agriculture area. Since 1999 illegal gold mining activities start to begin and bloom in the surrounding areas of the Sungai Melayu village, located on east part of the landscape on area of Pematang Gadung peat forest block. This activity has caused serious impact on river sedimentary and water turbidity. The illegal gold mining grew from 100 ha in 2000 to 15,000 hectares in 2010. In 2008 in the south of PT. RSM PT. Artu Borneo Plantation (PT ABP) started to operate with the POM (palm oil mill) start on 2016. The operation of PT. Artu Borneo Plantation give chance to local communities and transmigrant to work as a daily worker (*BHL-buruh harian lepas*) at PT. ABP and selling FFB to PT ABP POM as the new alternative since PT BIG's POM closed.

c. HCV Findings

The HCVs assessment in PT RSM found at least five types of HCV including HCV 1, HCV 2, HCV 3 and HCV 4 and HCV 5, with a total area of 189 hectares, where the HCV 6 are still under status of potential presence. The area indication of HCV 6 is on the east block of the concession in which related with Segar Wangi village.

Table 11. Summary finding of HCV identification on PT RSM

HCV	Definition	Present	Potentially Present	Absent
1	1.1. Areas that contain or provide biodiversity support function to protection or conservation areas.			
	1.2. Critically Endangered Species			
	1.3. Areas that contain habitat for viable population of Endangered, restricted range or protection species.			
	1.4. Areas that contain habitat of temporary use by species or congregation of species.			
2	2.1. Large Natural Landscapes with Capacity to Maintain Natural Ecological Processes and Dynamics			
	2.2. Areas that Contain Two or More Contiguous Ecosystems			
	2.3. Areas that Contain Representative Populations of Most Naturally Occurring Species			
3	Rare or Endangered Ecosystems			
	4.1. Areas or Ecosystems Important for the Provision of Water and Prevention of Floods for Downstream communities			
	4.2. Areas Important for the Prevention of Erosion and Sedimentation			
	4.3. Areas that Function as Natural Barriers to the Spread of Forest or Ground Fire			
5	Natural Areas Critical for Meeting the Basic Needs of Local People			
6	Areas Critical for Maintaining the Cultural Identity of Local Communities			

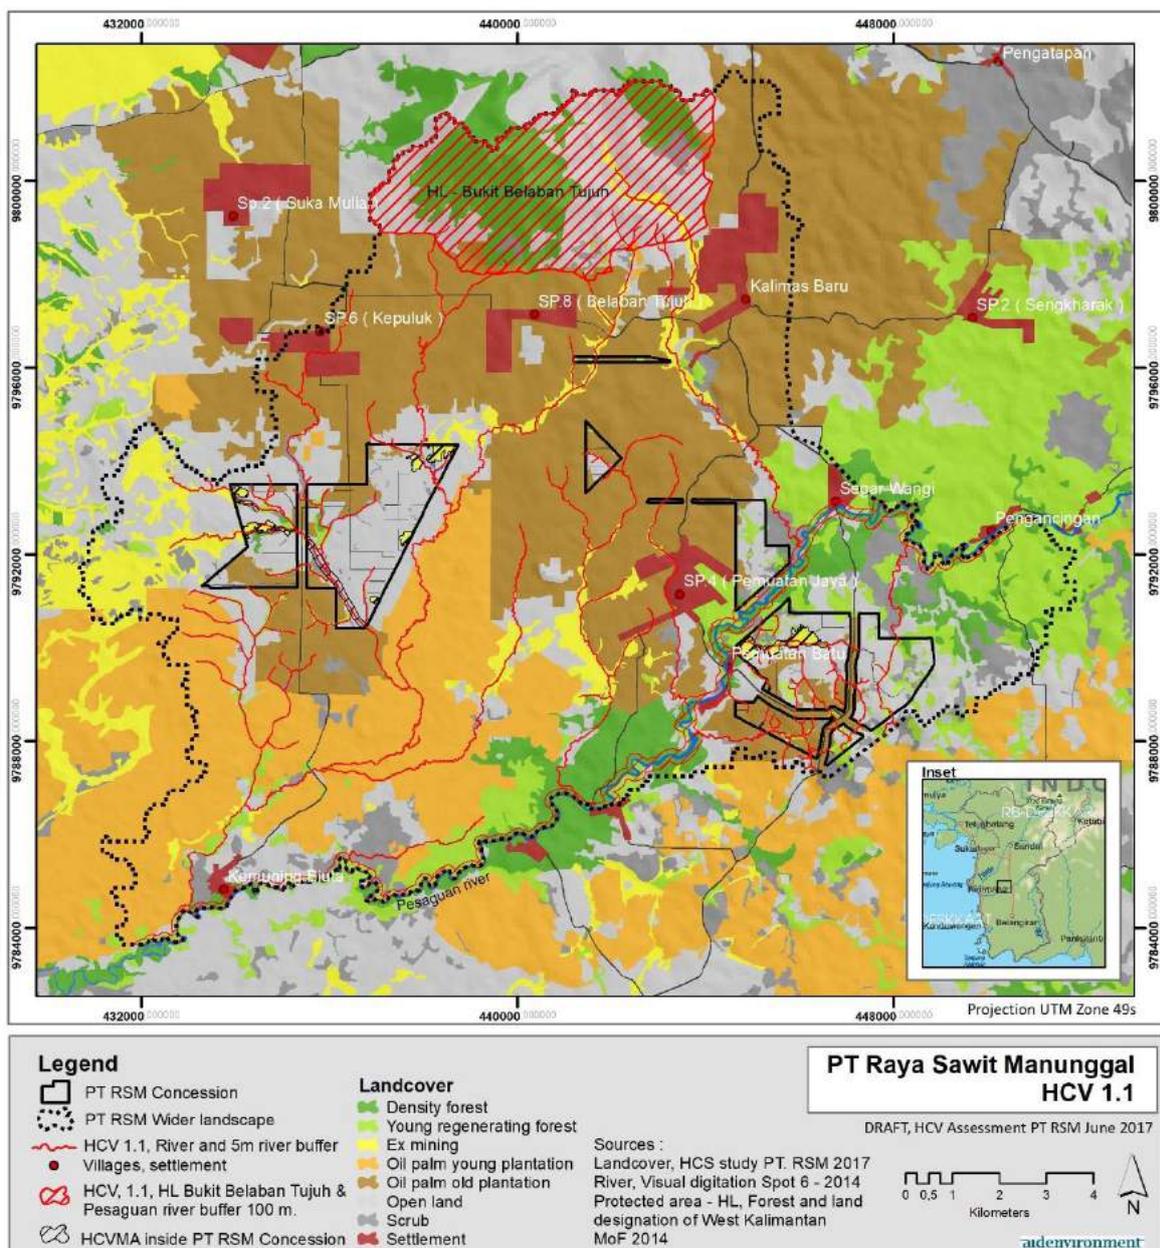

HCV 1. Areas with important level of biodiversity

HCV. 1.1. Areas that contain or provide biodiversity support function to protection or conservation areas.

Finding status; Present

The areas which has support function for the biodiversity on the concession areas found along the river buffer. Hutan lindung Bukit belaban tujuh as the only protected areas found in the wider landscape, located 4 km to the north of area concession. This area has serve for important hydrological function as catchment areas on the landscape, several rivers flows down to concession area and end on Pesaguan river. Others important area in the landscape is buffer of Pesaguan river which identified as areas important on biodiversity support where the areas remain with density forest.

Map 9. HCV 1.1 on the landscape and concession of PT RSM

The rivers width found on the assessment site in between 2-5 meters. Further analysis on determine the river buffer following Indonesian regulation PP 38 2011 which is applied for determine the width

of Pesaguan river buffer. For the river network in the landscape and concession area where the river width between 2-5 meter, the determination of the buffer width follows RSPO guidance of river buffer management which for the river in between 2-5 meter should be protecting buffer at least 5 meters on each side. The HCVMA area of HCV 1.1 includes the degraded rivers buffer in the forms of open area, scrub and or ex-gold mining area.

Rare, Threatened and Endangered species finding

Table 12. Shortlist finding list of plant species under category of HCV 1.2 and 1.3

No	Species	Family	Local name - Idn	IUCN	GoI	CITES	END	Location found

5	Elang brontok	Changeable hawk-eagle	<i>Nisaetus cirrhatus/ Spizaetus cirrhatus.</i>	Accipitridae	APP II		PP no 7	RSM 12

Note: END = Endemic to Borneo; CR-Critically Endangered, EN-Endangered, VU-Vulnerable ; LC-Least concern, NT-Near threatened (LC,NT,VU,EN,CR under IUCN redlist) , App.II = CITES Appendix II; PP7; Indonesian species protection under PP No. 7 tahun 1999. Full list of wildlife species can be found on annexes.

HCV 1.2. Critically endangered species

Finding status; Present

The concession contains habitat or ecosystem that support critically endangered (CR) species. From plant species list of found species *Shorea platycarpa* and *Shorea seminis* under protection status of critically endangered (CR – IUCN). The other potential CR species such as *Pongo pygmaeus*, *Manis javanica*, *Presbitis chrysomelas* and bird species *Rhinoplax vigil* which indicated potential present during desktop landscape assessment not present in during field observation.

Pongo pygmaeus still potential to be found, the most potential habitat suspect in the landscape are in the Bukit Belaban tujuh and buffer of Pesaguan river where those area consider as the most natural habitat in the landscape.

Pangolin species still under potential to be found in the landscape. Community interview reveal that this species still exists in small number of population, very rare and hard to find. Pangolin species population in this landscape suffer from excessive hunting several years back for meat and scales fulfill export market. From that case pangolin status conservation increase to CR since 2014.

Rhinoplax vigil still potential to be found, the most potential suspect habitat in the landscape are in the Bukit Belaban tujuh as this area is hilly areas with high density forest remaining and potential to have big trees from first strata for nesting place of this species

Further outside Bukit Belaban and Pesaguan river buffer all habitat in the landscape area has been suffered with high habitat loss, conversion and fragmentation, while the CR species which not present during field assessment to be survive need natural habitat with certain ecological attribute.

HCV 1.3. Areas that contain habitat for viable population of Endangered, restricted range or protection species.

Finding status; Present

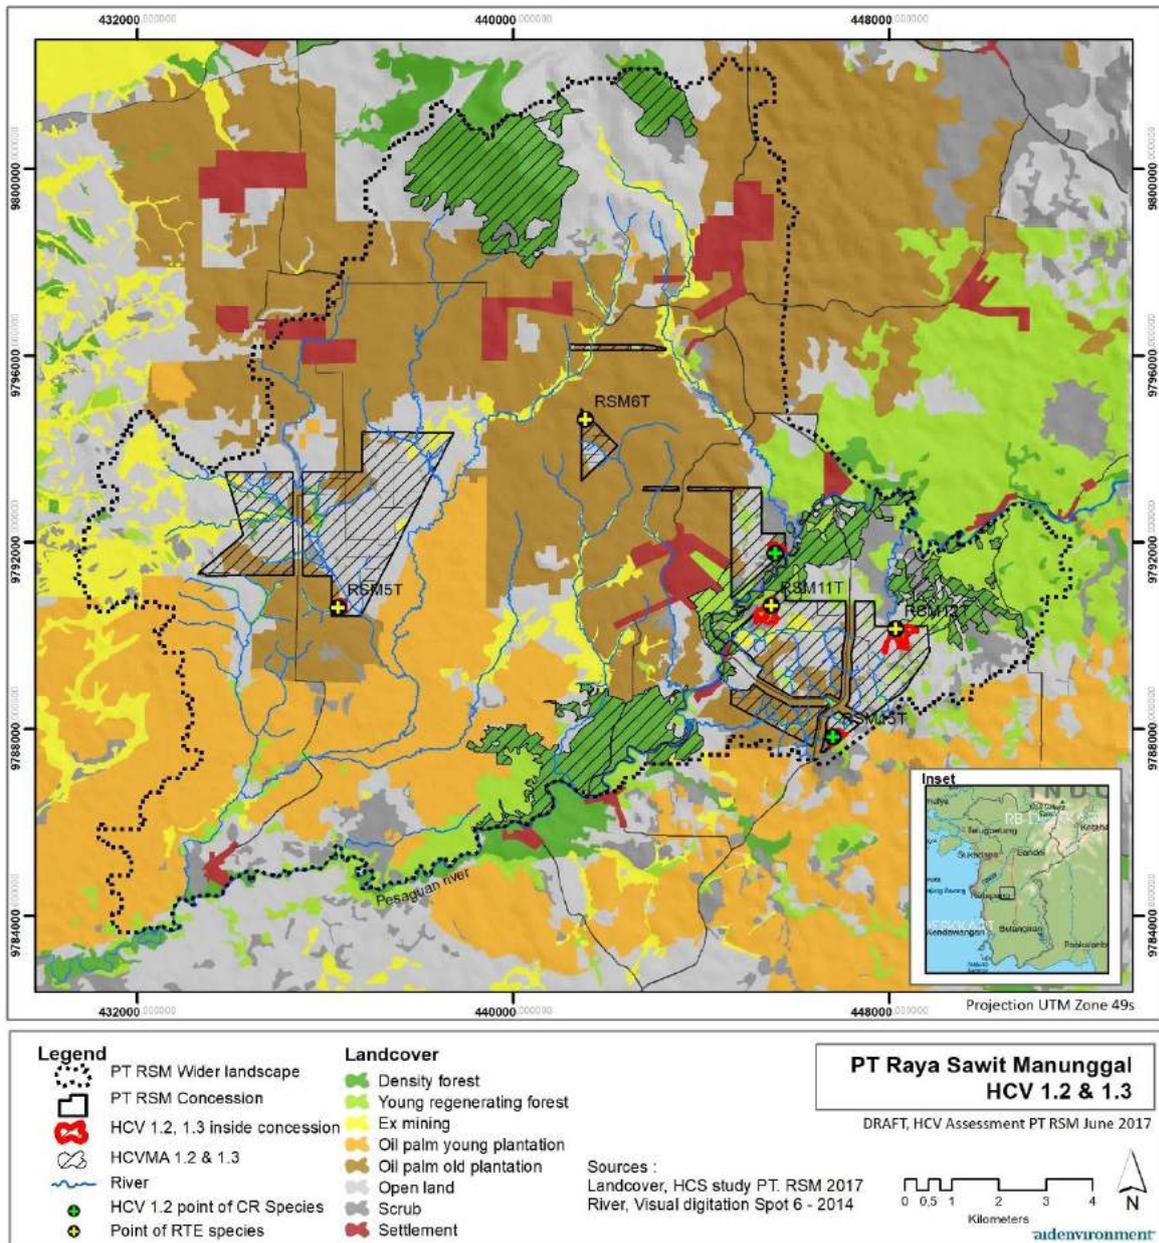

The concession and it wider landscape contain habitat or ecosystem that support endangered and restriction range or protection species. Analysis found;

1. Species found under critically endangered category (CR – IUCN) is *Shorea platycarpa* an *Shorea seminis*.
2. One plant and one bird species in under endangered category (EN-IUCN) are *Shorea leprosula* and *Pycnonotus zeylanicus*.
3. Three species are found under status of endemic plants, *Durio kutejensis*, *Shorea ovalis* and *Vatica umbronata*.
4. Four species of plants found under vulnerable categories (VU-IUCN) are *Durio kutejensis*, *Gonistilus bancanus*, *Eusyderoxilon zwageri* and *Shorea ugilinosa*.
5. Two plant species and one bird species are found in the CITES Appendix II *Gonistilus bancanus*, *Nephenthes gracilis* and *Elanus caerulus*
6. Four species of birds found under Indonesia species protection regulation *Elanus caerulus*, *Pelargopsis capensis*, *Rhipidura javanica* and *Niseatus cirhatus*.

Field observation found 135 plant species and 25 wildlife species, this finding considers low compared with the original number species in lowland forest of Borneo. No RTE primate and mammals species found in the finding list such as the Orangutan, *Hylobates*, *Presbitis chrysomelas* *Helartos malayanus* or the most common adapted species such as *Macaca fascicularis*. This absent related to the high level of habitat loss, fragmentation and degradation inside concession and its surrounding landscape. The landscape habitat has changed widely from forest vegetation to palm oil plantation since three decades ago, for areas outside of oil palm also has been suffered of gold mining activities and

traditional farming from communities. Regard with habitat assessment of species populations within minimum viable population (MVP) status, is not possible to assess in this HCV assessment. HCV assessment is a rapid assessment and in order to assess the habitat of viable species populations, a comprehensive assessment of both habitat and related species should be assessed.

Map 10. HCV 1.2 and 1.3 of the PT. RSM landscape

Two predator bird which under Indonesia protection which are *Elanus caerolus* and *Niseatus cirhatus* status found in the area concession. Findings of this to predator bird related with wide extend of open land dan shrub found in the landscape, where the areas served as hunting ground for both of those bird predator species. Further these two bird predator species avoid intact forest while hunting. Small bird, lizard and mouse are prey of this two predator bird. Nesting areas of this two bird predator suspect on the forested areas outside the concession. On the landscape there are Bukit Belaban Tujuh and Pesaguan river buffer which suspect as nesting place of this two bird predator, where those both suspected nesting area consider has support function from the density forest remaining. The distance

in between areas concession into Bukit Belaban tujuh on the north and Pesaguan river buffer on the south around 2-3 km from concession area which still in the range of two predator bird found in the concession. Based on observation this two predator bird from family Accipitridae have good adaptation capability within palm oil plantation landscape as long as these species is not hunted.

Mapping of the HCV Areas, all areas related to the findings of RTE species with habitat condition from natural vegetation such young regenerating forest or density forest defined as HCV areas. While the HCVMA defined on the areas with highly potential HCV species found such as Bukit Belaban tujuh and area with potential serve as connectivity and corridor which on the river buffer which potentially connect one population with another population.

Threats, threats to RTE plant and wildlife species can be threats to species and habitats. The threat may come from both internal and external parties. Internal habitat threats include the threat of land clearing during plantation land preparation, while external habitat threats include shifting cultivation, hunting, gold mining, drought and fires. Threats to plant species mainly from the felling of commercial species such as the types of *Shorea* spp, *Gonistilus bancanus* and *Eusyderoxylon zwageri*. Threats to the endemic species of *Durio kutenjensis* can be expressed as minimum, this related to this species whose fruits which are utilized by the community and the timber value of this species is not classified as a commercial wood species. Tengkwang as fruit-producing species are still concerned about the type of timber from tengkwang species including in commercial timber species. Threat of bird species especially to bird species Cucak Rawa (*Pycnonotus Zeylanicus*). This should be anticipated with threat patrol activities to be able to dispel the hunters of this species. The other bird species have no significant threat currently.

HCV 1.4. Areas that contain habitat of temporary use by species or congregation of species

Finding status; not present

The assessment landscape falls to lowland forest ecosystems with rolling plain and hills landform but there are no sites that support migratory species such as wetland (swamp, lake) or cave. Other, the overall habitat condition of the study areas has suffered with high level degradation and fragmentation. Assessment landscape also far from important bird area (IBA-EBA), key biodiversity area (KBA) or even Ramsar Site, Gunung Palung and Muara Kendawangan nature reserve are the closest with direct distance more than 60 km, Tanjung puting and Danau Sentarum as the Ramsar site even more farther.

HCV 2. Natural landscape and Dynamics

HCV 2.1 Large natural landscapes with capacity to maintain natural ecological process and dynamics.

Finding status; not present

Mapping analysis conclude that no part of the landscape and concession areas as the part of large natural landscape, where the large natural landscape ecosystem define as natural landscape patch with core more than 20,000 ha. Further analysis on potential impact of assessment landscape into Intact forest landscape (IFL) the finding conclude that assessment landscape and RSM concession areas not have impact into IFL condition, where no overlaps and no potential connectivity exist from landscape assessment into IFL area. Spatial planning analysis on future trend of landscape fragmentation found the assessment areas falls to APL land and not related with protected of conservation areas.

HCV 2.2. Area that contain two or more contiguous ecosystem.

Finding status; Not Present

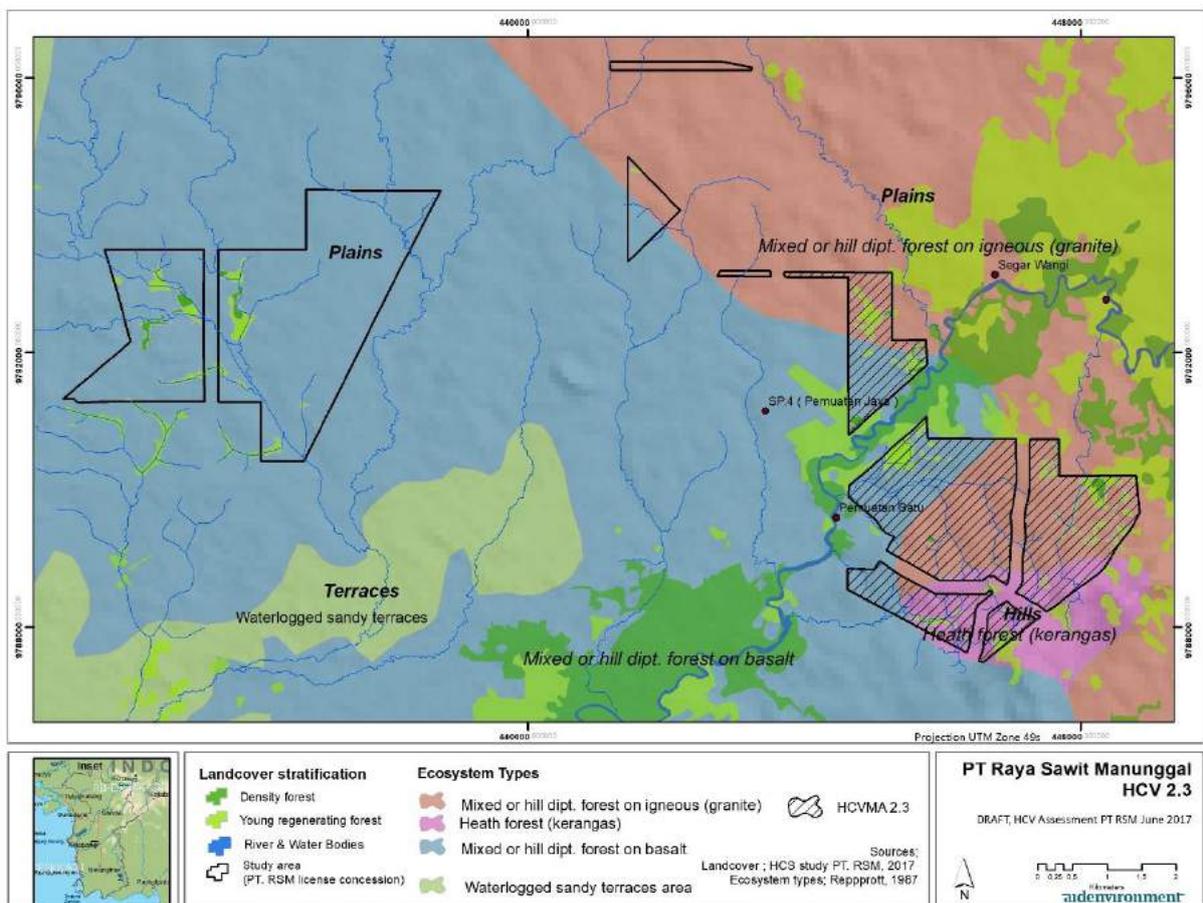

The general landform description of the landscape study area consists of plains and hills. In the plains areas as part of dipterocarp forest ecosystem above granite and dipterocarp forests above basalt, while in the hills areas falls to Kerangas forest ecosystems. Regard with ecosystem transition areas (ecotone) especially on contiguous transitional ecosystem areas, the verification process examines the transitional of the landform with land cover data in which the finding found there are no contiguous natural vegetation along the transitional area in between plains area into hilly area ecosystem.

HCV 2.3. Areas that Contain Representative Populations of Most Naturally Occurring Species

Finding status; Present

The concession areas contain representative population of most natural occurring species. On the species list found two species of birds predator which *Elanus caerulus* and *Niseatus cirhatus*. Both species defined as representative population of natural species found in landscape study. Both species concede as proxy of representative population of most natural occurring species (HCV 2.3). Protection of this species can be a proxy for protection from other species with smaller niches. Both of predator bird species found in the east block of concession. The analysis found east block concession in which as combination of plain and hilly areas and relatively close to the density forest areas on the Pesaguan river buffer which suspect has support function for nesting areas and the continuity of population both predator birds species. These east block concessions conclude as HCVMA of HCV 2.3. In the general landcover of the assessment landscape areas found large extend of open land and shrubs and palm oil plantation as ideal hunting grounds for both bird predator species.

Map 11. HCV 2.3 of the PT RSM landscape

HCV 3. Rare and endangered ecosystem

Finding status; present

The result on ecosystem status analysis of the wider landscape bio-physiographic southern plain and mountain found all types of lowland forest ecosystems are falls to threatened (Tr) ecosystem status. Further analysis found one type ecosystem has extinct which is *Mixed or hill dipterocarp forest on old marine sediments* ecosystem. The status of the sub-montane and montane forest ecosystems is still at a safe level although not the entire ecosystem areas are under protected areas status according to the West Kalimantan and Ketapang district spatial planning map.

The landscape study of PT RSM is in the lowland forest ecosystem zone which include ecosystem of dipterocarp forests above granite, basalt rocks and Kerangas ecosystem. Fresh water swamp and peat swamp ecosystems were not found in PT RSM landscape. Others, the study area is not part of intact landscape ecosystem of HCV 2.1. Mapping analysis of HCV 3 at PT RSM concession conducted by examine the presence of remaining natural vegetation as representative of threatened ecosystem vegetation. Analysis found several areas as remaining patch of natural vegetation within the PT RSM. The overall condition of the ecosystem condition in the concession has been heavily degraded and fragmented, the all remaining natural vegetation under young regenerating and density forest inside the concession to classified as HCV 3 with total 137.92 ha. The HCVMA of HCV 3 are the areas with potential for restoration such as ex-mining areas and degraded riverine buffers which are connected to area of HCV 3 identified.

HCV 4. Environmental service

HCV 4.1. Areas or ecosystem important for provision of water and prevention or flood for downstream communities.

Finding status; Present

Areas which serve function as provision of water or flood prevention for downstream communities found on the landscape. Landsystem of concession area falls to low land forest ecosystem zone with landsystem unit of RGK (Ragankau), HJA (Honja) and PLN (Pakalunai). These landsystem unit not related with areas important for prevention of flood such as swam, peat or karst. There are 4 sub-watersheds with the catchment areas identified in the landscape with the all rivers flows down and end into Pesaguan river as the main river of Pesaguan watershed. All the communities in the landscape sourced water from the river while alternative of clean water also sourced from the wells and collecting rain water. Water catchment in the landscape found on Bukit Belaban tujuh which serve function as the catchment of two river which flows down to Kemuning Biutak and Segar Wangi village. Other catchment area is in the center and east part of the landscape. On east part watershed the catchment area overlaps within block concession on the south hills where the river flow down to Segar Wangi village and Pemuatan Batu village (sub village of Segar Wangi). Analysis conclude that all river and river buffer as and catchment area as defined as HCV areas, while the degraded area on that HCV area defined as HCV MA. In defining the width of river buffers following Indonesian regulation PP No. 38. 2011 and RSPO guidance of river buffer management as discuss on HCV 1.1 section.

HCV 4.2. Areas important for prevention of erosion and sedimentation.

Finding status; Present

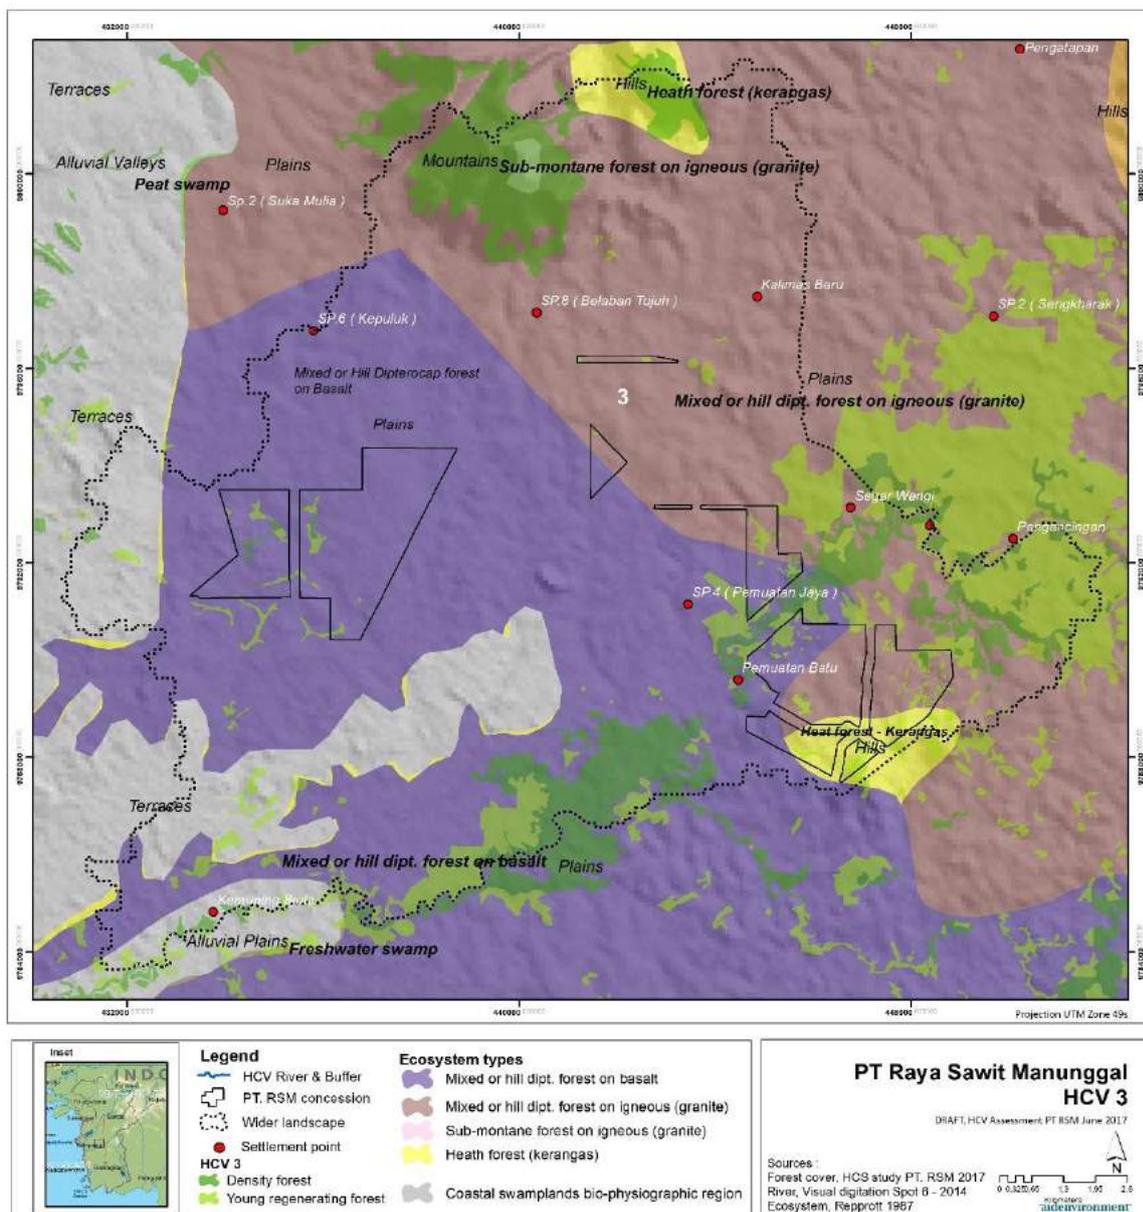

On the concession found areas which serve function as important for prevention of erosion and sedimentation. Concession area on the south block are consider as area with high slope more than 25%. This area serve function as prevent soil erosion and sedimentation (HCV A 4.2). Result of HCV 4.1

regard some part of area concession serve function as water catchment taking as outcome for determine HCV MA of HCV 4.2. To maintain value of HCV 4.2 the water catchment area in which falls inside concession consider as HCVMA of 4.2.

Image 3. Sandy soil on PT RSM

Map 12. HCV 3 of PT RSM landscape

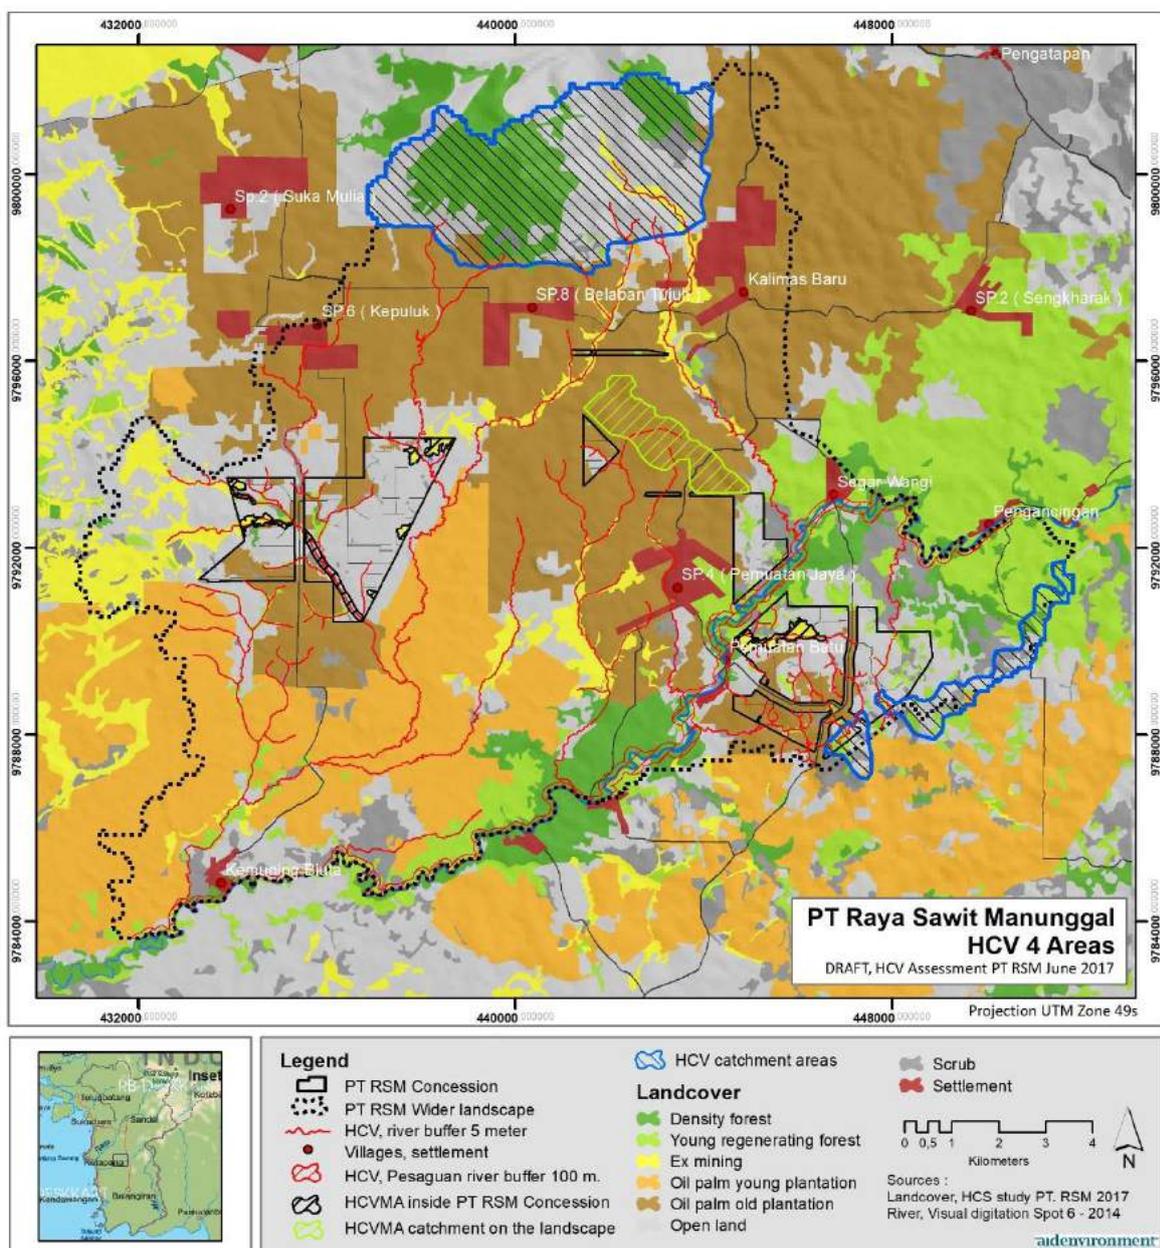

HCV 4.3. Areas that function as natural barriers to the spread of forest and ground fires.

Finding status; Present

On the concession found areas which serve function as barriers to the spread of forest and ground fires on remaining vegetation along the riparian buffers.

The landscape study falls to low land forest ecosystem zone which consist of heat forest of ecosystem, dipterocarp forest above Granite rock and dipterocarp forest above Basalt rocks. These three types of ecosystems are not good on retain the surface water and vulnerable to drought and fires. The condition of the three ecosystems on the landscape has been degraded, the fuel form of biomass deposits in the ground are quickly dry out. HCV4 consider on the wet areas along the rivers buffer. HCVMA considered on area of ex mining and degraded riverine buffer for 103,84 ha. Those areas need to restore with natural vegetation and in the future will serve function as HCV 4.3.

Map 13. HCV 4 of PT RSM landscape

HCV 5. Natural areas critical for meeting the basic needs of local people

Finding status; Present

In the demographic and socioeconomic aspects of the wider landscape there are several settlements. The settlement is a combination of native villages and transmigration villages from the PIR trans project which started in 1992. The native villages are Sungai Melayu, Kemuning Biutak and Segar Wangi Village. While the transmigration villages are SP.6 Kepuluk, SP.8 Belaban Tujuh, Kalimas Baru Village, and SP4-Pemuatan jaya village.

The analysis of subsistence fulfillment is more pronounced in 3 native villages this is related to the wider resources of basic needs fulfillment than transmigration communities, although native villagers are also participants of previous Tran PIRs which limited for the elder. The source of fulfillment of the basic needs of transmigration communities is primarily met from the agricultural land area of the previous PIR Trans project allocation. A clean water supply analyst is conducted for transmigration village villages and native villages.

From the accessibility analysis of the landscape states that all the settlement on the landscape study is not an isolated settlement. The area has been covered with road access since the Trans PIR project. With the open access the local economy starts to generate start with FFB selling to the mills and the level of community dependence on land and forests start to be declined. Currently the source of fulfillment needs of the local communities has been diverse, mainly working as a day laborer of a palm oil company around.

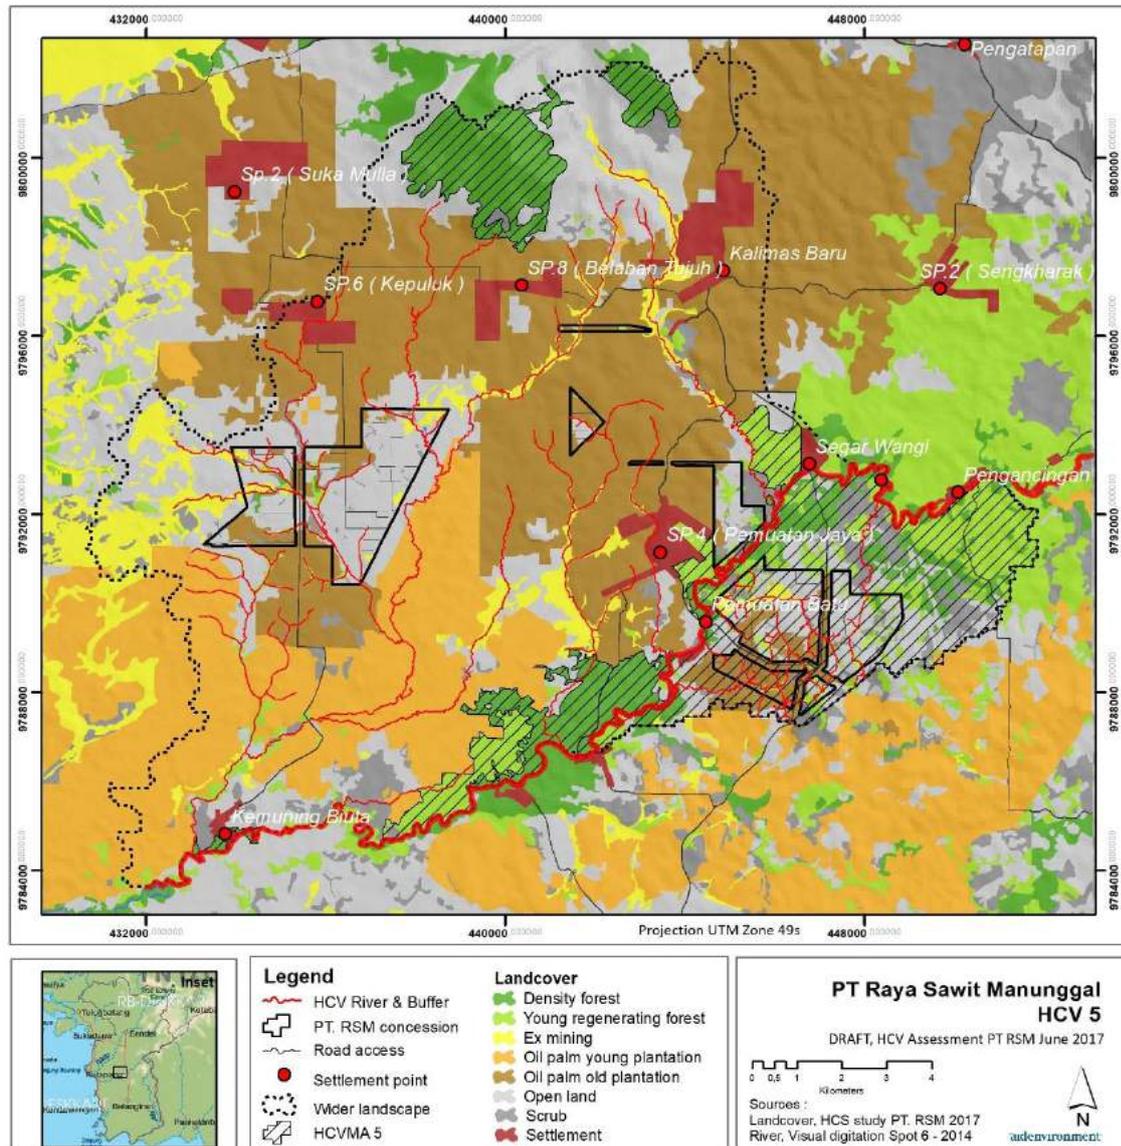

From the socio-economic analysis of dependence on the fulfillment of basic needs (subsistence) of the community such as the fulfillment of food needs (carbohydrates, proteins and vegetables), clothing in the form of fiber for clothing, housing, equipment, energy, clean water, medicine and cash with landscape studies, it is concluded that the study landscape still provides support for the fulfillment of these basic needs. This is limited to landscape support on the fulfillment of clean water needs. The areas that are important as a source of clean water are Bukit Belaban Tujuh-Bukit Keseduk (score 3) and the fulfillment needs of household water (bath-wash) from the rivers that flow around the settlements. This applies both to indigenous villages and transmigration villages. Another important point river as a source of livelihood for some villagers of Kemuning Biutak (river score 4), where several community members work as fisherman. It is concluded that the Pesaguan River and the network of tributaries along with its border in the landscape study and its catchment areas defined as HCV 5 areas. This conclusion also relates to the results of HCV 1 and HCV 4 mapping.

Traditional shifting cultivation is still done by some villagers of Segar Wangi (score 4). Although the yield not satisfactory. The analysis on the yield decreasing relate with decline ecosystem function support to bring back the fertile soil on the cycle of traditional shifting cultivation. This caused from the slow of vegetation succession to reach secondary forest that expect to bring back soil fertility on the site of shifting cultivation site. Other factor is the frequent occurrence of forest fires (mostly annual) causing loss to make the natural forests farther from shifting cultivation areas, where natural forest as an important vegetation seed dispersal source. From this condition field survey observed that shifting cultivation is very important for several Segar Wangi villager, location mapping for this area cannot be done due to time limited of social survey.

All villagers from native villages work on rubber garden as a hereditary in the form of natural rubber (jungle rubber) as one source of cash money income. Although currently some people say less important (score 1) and important (skor2) this is due to falling prices of rubber commodities. Recognized by the entire community they still look after their rubber garden as a reserve of livelihood

in the future. The form of natural rubber cannot be distinguished from secondary forests during the interpretation process of land cover through satellite imagery, jungle rubber will fall to density forest class and regeneration forest. This jungle rubber field mixes with the native trees species mainly fruits produce trees such as Durian and other native local fruits that are used and consumed by the community. Therefore, the remaining density and young regenerating forest areas identified in the study landscape are identified as HCV MA areas.

Map 14. HCV 5 of PT RSM landscape

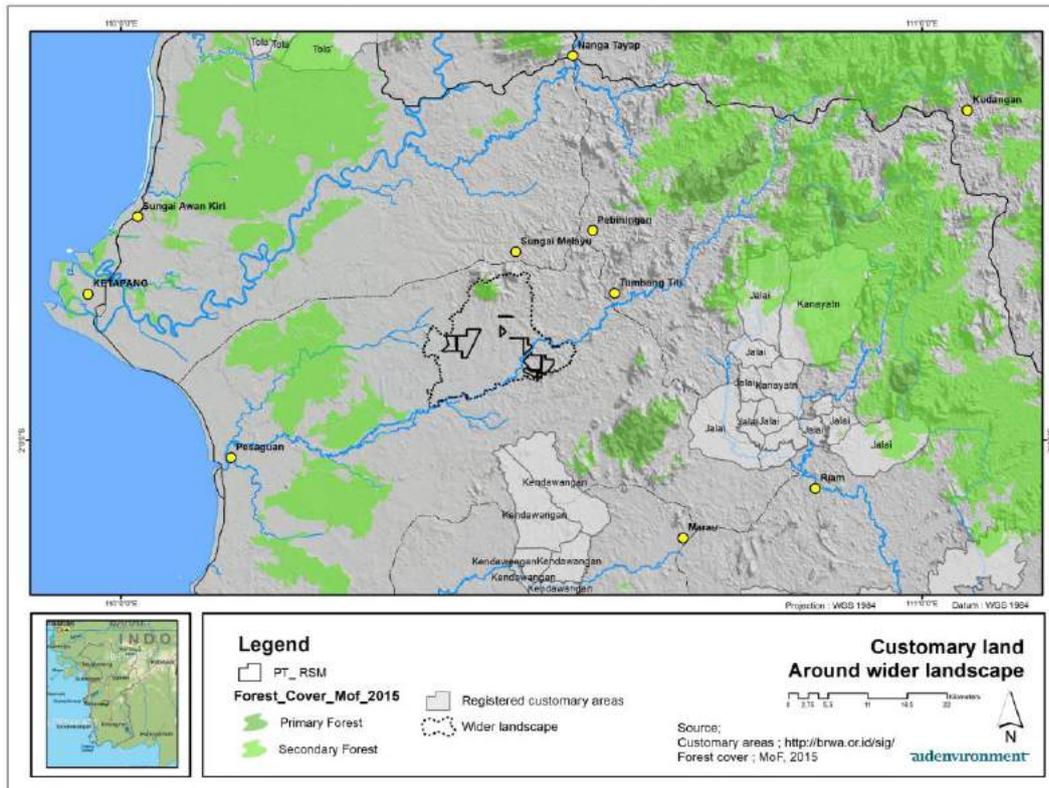

HCV 6. Areas and species critical to local communities' traditional culture identity

Finding status; Potentially Present

HCV 6 aim to identify areas that have an important function for the traditional cultural identity of local communities and the area is needed to meet their cultural needs. The interconnectedness of the community to the landscape is manifested by the ideas, norms, values, activities and behavioral patterns. Natural resources, environmental conditions and objects around will underlie the collective behavior of community and its govern the relationship between the community and the landscape.

Traditional community groups around the assessment area are verified with data on customary territories. The data used in this study is the BRWA⁴ data, the overlay result indicates that the community groups on the landscape study are not included in the customary territories which are registered on BRWA data. According to BRWA data there are indigenous communities of Kendawangan in the 10 km to the south of the landscape study. The other indigenous community's territories are in 30 km to the eastern part of the landscape study of area Jelai and Kanayatn communities. The next following is an overlay of the landscape study area with customary land territories area, based on BRWA data.

Map 15. Customary land verification base on BRWA registered areas

In the landscape study communities from 3 native villages confirm there is no archaeological in the landscape. The cultural orientation of community has shifted from a culture customary based to a religion-based culture both Islamic and Christian. It is also stated that there are no more material which are attributes of customary rituals. The material are no longer found in the landscape of study, such as the feathers of the hornbills as attributes of Dayak customary clothing.

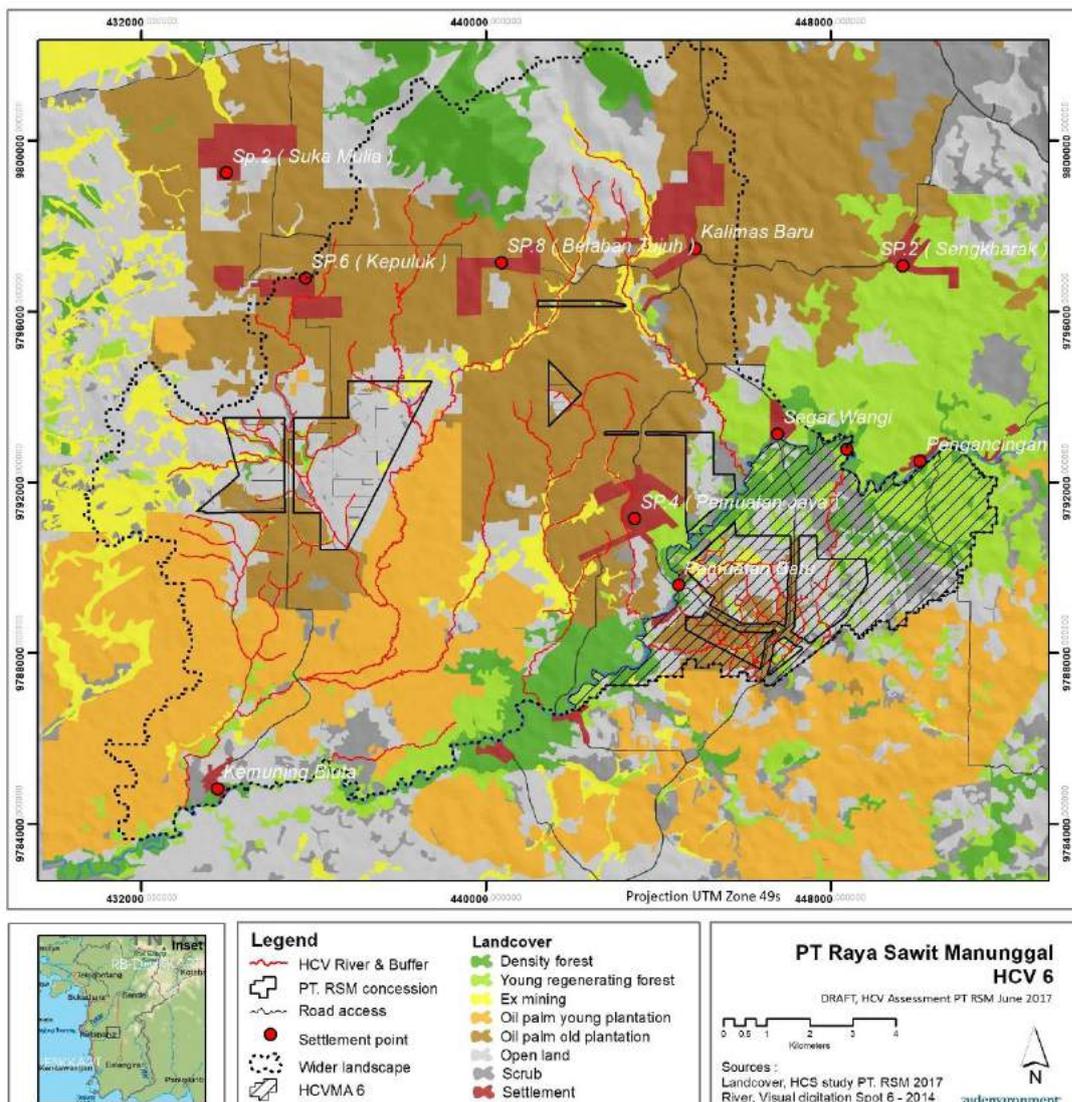

In the village of Segar Wangi there are still forms of Tembawang enclave which have been retained since the previous PIR Trans project . The tembawang enclave is a hereditary land of heredity or identity of community members which comes from one family. Confirm by 3 native villages there is no more land in customary land status or communally land tenure forms. The system of land ownership in the three villages is in the form of individual land ownership while there is also land in the family ownership status as the legacy of the predecessor.

⁴ Badan Registrasi Wilayah Adat (BRWA) is a central registration for customary land. BRWA formed in 2010 by social NGO group [Aliansi Masyarakat Adat Nusantara](http://www.aliansi.org) (AMAN), [Jaringan Kerja Pemetaan Partisipatif](http://www.jkpp.org) (JKPP), [Forest Watch Indonesia](http://www.forestwatch.org) (FWI), [Konsorsium Pendukung Sistem Hutan Kerakyatan](http://www.konsorsium.org) (KpSHK), and [Sawit Watch](http://www.sawitwatch.org) (SW). <http://brwa.or.id>

In Segar Wangi village confirm by the community there are several sacred sites which in Segar Wangi. HCV Social Team has found difficulties to access these sacred areas due to concerns (in the form of rejection) of some community members who have granted gold mining concession permits to outsiders. The granting of mining concessions is informal, initially the village government supports the HCV team to have field verification, but on the day scheduled there are some community members who prevent the HCV team from being able to documented the sacred area in the field. No cultural sites were found in the Sungai Melayu village and Kemuning Biutak. In the Segar Wangi village there are several sacred sites associated with the history of religion missionary (Islam) and the history of heroism that lies outside the concession area, such as;

1. Syech Abdullah burial, located in the middle of settlement of dusun II, which also known as Tambak Burial.
2. Datuk Kyai Uban burial
3. Sacred areas Sungai Kedang
4. Pahlawan Uti Tunggal burial
5. Kedang/pahlawan burial (commander of Tumbang Titi) on Pengancing hamlet
6. Sungai Satar sacred burial site.

Map 16. Potential present of HCV 6 on PT RSM the landscape

d. Initial Stakeholder Consultation findings

On May 4, 2016 an initial public consultation as part of field scoping study was held at the Kecamatan (sub-district) of Sungai Melayu Rayak, it was attended by 34 participants from various stakeholders include representative of stakeholder in the landscape include the government communities and NGO. The government representative came from native villages, transmigration village, sub district Sungai Melayu, Tumbang Titi, Pemahan and representative of Ketapang district government,

During the initial public consultation, the potential presence of HCV 1-6 was present to the audience. The next follow subject was presented and discuss during initial public consultation.

- Presentation of HCV and its category include the importance of HCV assessment in PT RSM,
- History of land use and current utilization and related maps
- Environmental service aspects, and indications of protection areas
- Potential present of RTE species
- The threats discussion of concession area from drought, fires mining and wildlife hunting also species trading
- HCV 5 subject was consulted covers the current livelihoods of the community and the utilization of natural resources as fulfillment of their basic need. HCV 6 was on the consultation and confirmation of indigenous customs and its cultures and important area related to cultural identity of the local community. The next following are the key point the outcomes of the public consultation process;

Table 14. Resume of initial public consultation on Sungai Melayu Sub District

Name/Title/ Organization/Role	Concern/Response/recommendation
Tumbang Titi Sub district head	<p>Tumbang titi district head, in general, area of PT. RSM located on SP (transmigration villages/settlement), then how the development of plantation and replanting will be carried out?</p> <p>PT RSM Response, That all areas farmers land that falls into the HGU and location permit license will be compensated by the company. The land which fall to izin lokasi extension will compensated under"GRTT" scheme and the community managed land which falls to HGU will compensated under "tali asih" sheme. For the previous partnership garden with PT. BIG will not part of compensation scheme, this area will be entering into new partnership program (replanting partnership program).</p> <p>Tumbang Titi Sub district head, I see there is already a technical planning for water control and management, but it is still limited on HGU area, my suggestion on area which falls to location permit area can do the same</p> <p>HCV team response; Related to water management, this issue will be an important point which will be related to the vulnerability status of this region on drought and fires, so the recommendation from the sub-district head will be in our concern in the assessment, especially related river and its buffer include water management in the concession area.</p>
Name: Abu Khuraira Title:	Abu, In the PT. RSM there is no more forest remaining, regard with this HCV process, do this process can come up with solutions providing the forest especially in critical areas.

Village head of Kalimas Baru	HCV team response; Yes, we agree and will notes that the management recommendations of this HCV should respond critical areas that are still worth for conserving HCVs, in which to maintain and enhance the value through restoration activities.
Name: Edi Yayasan Palung Staff	Edi, I know that there is no peatland in areas of PT RSM, but there are many rivers. I suggest that these river buffer should be managed and not converted into oil palm. The landscape area being studied as prone to fires in the dry season, so it is imperative to do water conservation. HCV team response; Thank you, it already on our noted, the threat of drought and fires as an important point in the future management of identified HCVs.
Pemahan Sub district head	Sub district head, This is a good effort to manage the surrounding environment but how can we monitor this effort? I think its needs a good communication system in between company and the surrounding community. HCV team response; It is important to work with the stakeholders in the management of HCV area. We would recommend it to PT RSM in its management process to engage key stakeholders regarding HCVs management.
BKSDA staff of Ketapang	BKSDA staff, I suggest for PT RSM can to follow up the results of this study and collaboration with BKSDA for the management of protected species and their habitats. HCV team response; It is important to work with stakeholders in the management of HCV areas especially with the findings of RTE species, we will have noted in the recommendation and monitoring document.

Image 4. Foto documentation during initial public consultation, may 4, 2016

e. Public consultation findings

The public consultation was conducted in 3 related villages Kemuning Biutak, Sungai Melayu and Segar Wangi village, conducted on 20-21 April 2017, in this process field findings was present to get confirmation from the communities. The next following table are the important point recorded during the process of public consultation.

1. **Sungai Melayu village** attended by 25 participants who are mainly village and dusun (sub village) administrative staff of Sungai Melayu.

Table 15. Resume from public consultation minutes on Sungai Melayu village

Name/Title/ Organization/Role	Concern/Response/recommendation
Sukur (DAD) dewan Adat Dayak - (representative of Sungai Melayu Dayak)	<p>Sukur, it seems important for us to be able to monitor the implementation of this HCV study, and it is important to obtain a document of the management plan so that it can also monitor especially on the river buffer as the most violation happen from the land clearing process.</p> <p>Response of PT RSM, We will improve communications with land clearing contractors, please also tell us if there are demolished river borders.</p> <p>Response of team HCV, Thanks, we will note that these is a form of threat from internal operation to the HCV area.</p>
Suandi Community member Sungai melayu	<p>Suandi, I asked how the practice of integration of plantation development with rural villages development</p> <p>Response of PT RSM, We need to explore more information about the needs of the community, recently CSR for Sungai Melayu has not been channeled. Please to Mr. Kades to invite PT. RSM CSR staff during the Musrenbangdes meeting (annual village development planning) so the development in between village program can be synergized with plantation process development.</p> <p>Response of team HCV, HCV is not a conservation area such as a National Park or Nature Reserve, but the management should ensure the sustainability of HCVs either environmental or social benefits. We noted Regard the HCV management and how to be integrated with villages development and will elaborate on the management and monitoring document.</p>
Kidung Village head of Sungai melayu	<p>Kidung, another thing is related to Bukit Belaban Protected Forest behind this village, the water debit has recently decreased and is not sufficient for the entire community in the Sungai Melayu village.</p> <p>Response of PT RSM, Agree with the conservation efforts of Bukit Belaban, then the conservation program to be discussed later between the village staff and PT. RSM.</p> <p>Response of team HCV, Bukit Belaban is a water catchment area for rivers which flows down to the concession area of PT. RSM. Maintaining HCVs river-related within the location permit itself cannot ascertain the improvement of the quantity and quality of the river water. We noted for the management of HCV will be able to reach the area of Belaban Tujuh as the important catchment area.</p>

2. **Kemuning Biutak village**, attended by 21 participants, who were mainly village and dusun (sub village) administrators staff of Kemuning Biutak.

Table 16. Resume from public consultation minutes on Kemuning Biutak village

Name/Title/ Organization/Role	Concern/Response/recommendation
Rudi Village head of Kemuning Biutak	Rudi, about all the rare animals presented, almost all of them has been extinct in the surrounding area. Pangolins are still there, but now being hard to find. About the sacred sites of are not present in the locations permit as show on the map HCV team response , about pangolin species we need further information related to these animals, especially the location where the commonly found.

3. **Desa Segar wangi**, attended by 15 participants who mainly are village and dusun (sub-village) administrative staff of Segar Wangi.

Table 17. Resume from public consultation minutes on Segar Wangi village

Name/Title/ Organization/Role	Concern/Response/recommendation
Thamrin Village head of Segar Wangi.	Thamrin, there are several old enclaves since the time of PT BIG formerly and now in the location permit or HGU PT RSM, we are asking to be maintained only for the benefit of the community and do not be converted into oil palm. HCV team response; Thanks, we need further confirmation regarding those enclave location and what community benefit are being met from those old enclave areas. Thamrin, my suggestion regard compensation process with our villager to involve villages staff as to mitigate future problem that might be arise from the payment of land compensation.
Yayan Jabatan Village staff	Yayan, confirmation of residents there is no sacred area from the assessment area shown on the map. HCV team Response; Our thanks need further confirmation regarding this, especially in the sacred areas as presented by Mr. Thamrin.
Sudirman Village staff	Sudirman, we need mapping assistance for the completion of the village boundary between the villages of Segar Wangi and Batu Tajam. HCV team Response; Yes, we do agree, the village boundary is important not only for administrative matters, HCV management and monitoring program should identify relevant stakeholder from villages related with location HCV findings

Attendee list of public consultation forum can be found on the attachment section

4. Transmigrant Settlement

The Transmigrant settlement that related in the wider landscape are SP.6 Kepuluk, SP.8 Belaban Tujuh, SP.3 Kalimas Baru, dan SP 4. Pemuatan Jaya. The innitial public consultation and social survey has been

conducted, except the final public consultation. Several important points from the initial public consultation and social survey are :

1. The basic livelihood of the transmigrant mostly fulfilled by the land allocation from the previous transmigration project which is 2 ha allocated for main agriculture and 0,5 ha for houses.
2. Regarding to the land use, the transmigrant are respecting to the local land use system. In case to utilized the land outside the transmigration land allocation it only happen by renting or buying to the local people.
3. River and tributary around the transmigrant settlement serve as source of basic fulfillment for clean water (not for drinking water)

Part 5 Management and Monitoring

a. Threat assessment

Forms of threat to HCV areas can be viewed from direct-indirect or internal-external. Overview of the form of internal threats can result from company operations and employee activities such as land clearing, hunting, habitat fragmentation, pollution from chemicals such as herbicides, pesticides or fertilizers that can affect the soil, water and wildlife especially insects which have important functions in plant pollination. The threat from the community and other outsiders can be regarded as an indirect threat and external threat. Several external - indirect aspects that can be identified with qualitative approaches during HCV data collecting process and consultation with PT RSM management, among others;

Table 18. General external HCV threat identified during the assessment

No	Threats source	Source specific/ Impact	Source rating	Current status of mitigation	Handling recommendation
1.	Area concession falls to area traditional used of local people. Traditional used of 3 native villages	Traditional tenurial systems apply to all area concession licenses Impact ; uncompleted FPIC remain community control the area HCV areas.	High, especially on Segar Wangi village	most of area concession are still on progress of land compensation	Continue the FPIC process and develop incentive program for areas identified as HCV 1-4.
2.	HCV compensation value is lower than non-HCV areas	HCV land is not released by the community regarding the less value of the compensation. Impact ; the HCV areas will not release by the community and The HCVs cannot be managed	High	HCV compensation value is lower than non-HCV areas	Continue the FPIC process and develop incentive program for areas identified as HCV 1-4.
3	The drought and fires	External (community) Impact ; Loss of HCVs	High	Awareness raising on not using fires during traditional land preparation Collective fires handling between concession and communities	Community training on free fire land preparation. Water management and water level control. River buffer restoration.

4	Development of partnership plantation	HCVs areas owners cannot be able to participate in partnership schemes. Impact HCVs areas not compensated cannot be managed	high	Partnership schemes that require land submission of prospective farmers participants.	Continue the FPIC process and develop incentive program for areas identified as HCV 1-4.
5	Gold mining activities	The area is still control by the community, the community allow the miners to work on their land. Impact Losing HCV areas	High	N. a	Maintain communication with village government and representative local police Police reporting on mining activities inside consession.
6	Traditional farming	The area is still managed by some people still active doing farming esp. From Segar wangi village	high	N.a	Continue the FPIC process and develop incentive program for areas identified as HCV 1-4.

b. Management and Monitoring

The nature of HCVs is a voluntary conservation effort, in this situation the HCV need the support of all stakeholder related especially landowners or land users. FPIC efforts coupled with incentive forms can provide an impetus to reach agreement on HCV conservation areas. The HCV area currently not yet fully protected within Indonesian regulations. HCV areas can only be protected by the regulation if there is a detail spatial planning implemented. There is oppotunity to promote HCV in Indonesia through PKP policy (*pembangunan kawasan perdesaan – integated-intervillages development*) as the implementation of PKP policy required detail spatial planning of the rural site development promoted. Unfortunately PKP policy currently very limited in the implementation. Within this situation the areas that have been covered in AMDAL documents as protection areas such as river buffer do not receive wide attention from the parties, especially local governments where to govern overall district river buffer protection, district government need equipped by district regulation (PERDA) related river and it buffer protection.

One important point related to the presence of river values and its buffer as representatives of HCV 1, HCV 4 and HCV 5, which is the source of the fulfillment of clean water needs for transmigrant sattlement, the results of this study should be continued consult in 4 transmigrant sattlement, in particular with respect to the protection of rivers and its buffer in the landscape of the study. It is important to be able to identify the threats of rivers and its buffer related to land use and ownership patterns in riparian areas. Previously the transmigration community was only involved in the initial consultation and became a respondent in the interviews and FGDs but not yet involved in the final consultation process of this HCV study. Recommendations for consultation processes in these transmigration communities can be integrated with follow-up FPIC processes that are part of HCV management and monitoring. The following matrix describes the management objectives of common threats to HCV conservation areas and their management and monitoring recommendations.

Table 19. HCV Management and monitoring matrix of PT. RSM

HCV	HCV findings description and its management objective	Current and potential Threats	HCV management		HCV monitoring
1.1	<p>Finding River and river buffer of the concession defined as HCV 1.1</p> <p>Management objective ; The protection of river and river buffer which have function for biodiversity sites habitat and potential connectivity habitat to other habitat outside the concession</p> <p>HCV MA, degraded river buffer on block 2 in form of open area, shrub or ex mining area.</p>	<p>External ;</p> <ul style="list-style-type: none"> - Mining, trees felling, traditional farming, drought and fires - River buffer conversion by communities for agriculture - The demand of partnership scheme since river buffer as part of community land. <p>Internal ; Land clearing process by the contractor which may lead clearing of river buffer and or erosion impact.</p>	<p>HCV management</p> <ul style="list-style-type: none"> - Marking river buffer boundaries in which the width following guidance in RSPO river buffer management. - River buffer vegetation management through periodic forest inventory on develop database of vegetation species composition and regeneration level. - Wildlife observation on river buffer area related species under protection status, population and its ecological attribute. - Restoration or species enrichment on degraded river buffer in form of open area, shrub or ex-mining. - Maintain good communication with the land clearing contractor to avoid clearing the area. <p>Tenure status on river buffer HCV</p> <ul style="list-style-type: none"> - Identifies the land owners - Continue the FPIC process and develop incentive program which targeted into the land owners. - Continue the FPIC process until reach target agreement on co-management of HCV areas. <p>HCVMA inside concession</p> <ul style="list-style-type: none"> - Vegetation restoration on degraded area along the river buffer block 2. <p>HCV MA on the wider landscape.</p> <ul style="list-style-type: none"> - Promote co-management with Sungai Melayu village on restoring Bukit Belaban tujuh protected forest and degraded river buffer in between PT RSM concession and Bukit Belaban Tujuh. 		<ul style="list-style-type: none"> - Security patrol on river buffer identified as HCV 1.1 area, on various threats of mining activities, trees felling, traditional farming, - Weather monitoring related drought and fires. - Periodic Inventory to assess the quality of vegetation, species composition and regeneration level. - Periodic wildlife observation to monitor the RTE population related to river buffer. - Periodic monitoring of seedling growth from restoration or enrichment program along the river buffer
1.2	<p>Finding; Plant species HCV under protection status of CR-IUCN found on block 9. <i>Shorea platycarpa</i> <i>Shorea seminis</i></p>	<p><i>Threats on IUCN website;</i></p> <p><i>Shorea platycarpa,</i> <i>Shorea seminis and</i> <i>Gonystylus bancanus</i> <i>Logging and wood harvesting on</i></p>	<p>Threat finding for species under CR-IUCN status.</p> <ul style="list-style-type: none"> - Mining, trees felling, traditional farming, drought and fires 	<p>Management recommendation (write together as the areas of HCV 1.2 and HCV 1.3 falls to same overlap area);</p> <p>RTE species habitat both plant and animal ;</p> <ul style="list-style-type: none"> - Marking habitat location - Protection of the species and habitat. - Periodic inventory and observation of the RTE species regard with quality population of the RTE species and regeneration level, 	<ul style="list-style-type: none"> - Security patrol for all RTE species and its habitat, especially for <i>Pycnonotus zeylanicus</i>. - Population periodic monitoring of RTE Species, habitat quality,

		Total HCV 187.49 hectare	Total HCV MA 2,085 hectare	

c. Go and No-Go Area Recommendation

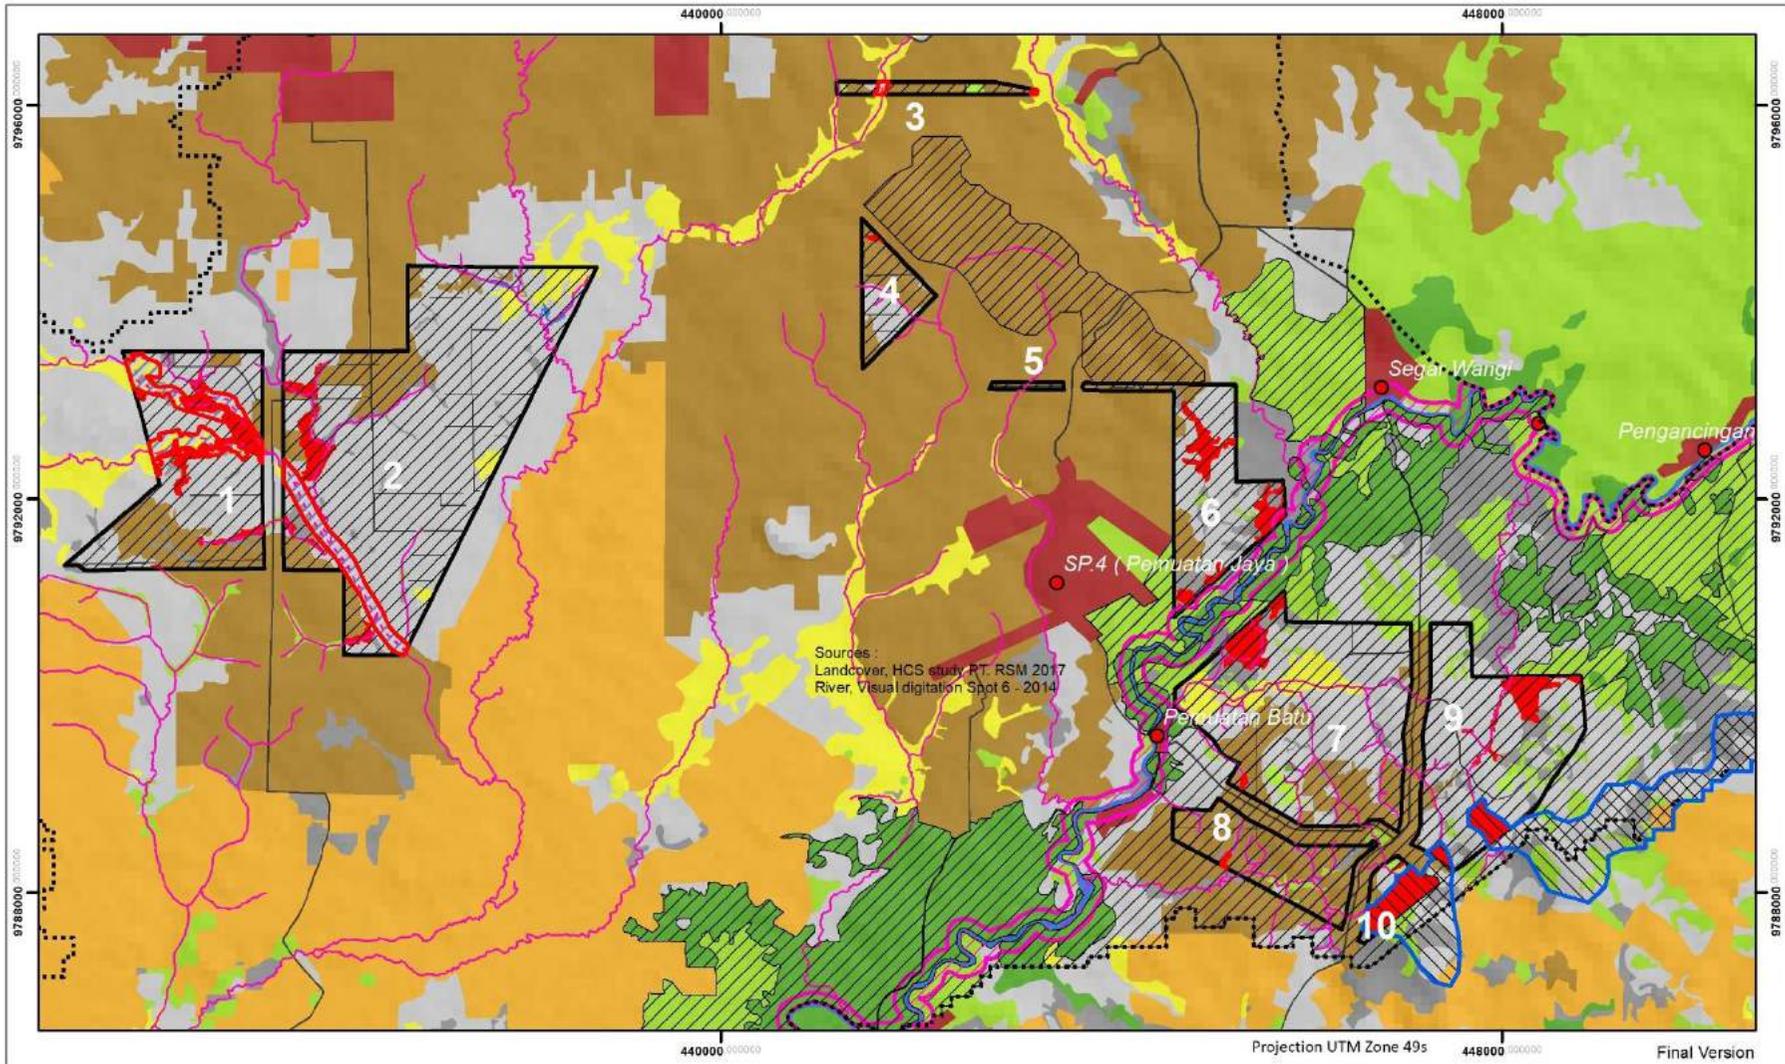

In the HCV guidance document, 2013 states that HCV Management Areas are areas in a site, MU or landscape for which appropriate management decisions must be taken and implemented to maintain or enhance an HCV.

The analysis found some part of the HCV areas identified inside the concession have been degraded in the form of open land and shrubs and ex gold mining operations, where this area ideally serve function on retain erosion sediment to the river. All the HCV areas identified inside concession connected with the river buffer, as this area has potential to connect fragment of HCV.

Regard with condition this study has indicate area of HCVMA should manage in form of remediation, restoration with natural species or combination of remediation with civil engginering and planting with palm oil.

As the cases in block 2 and 7 of the concession where there is ex gold mining along the river buffer, where function as HCV is currently absent and and being threat to the river from high sediment since river buffer fail to function. Better management option is combining the remediation with civil engineering and planting palm oil, where restoration option with native tree species will be very difficult since gold mining was washed out the soil on the area. Civil work in form of dike on avoiding flood and retain sediment erosion on HCVMA areas which adjacent to river body. On the other side there is No Go HCVMA areas as indicates in the next following map.

Map 18. Go No Go recommendation of HCVMA

Legend

- HCV River & River buffer

Statement of Responsibility

On behalf of Bumitama Gunajaya Agro we have accepted the HCV assessment result and will undertake the implementation of the guidelines HCV management and monitoring provided in the report.

Date: Jakarta, June 6, 2017

Name : Hidayat Aprilianto
Title : Sustainability System Development and Mitigation Head Department, Bumitama Gunajaya Agro

On behalf of Aidenvironment, I hereby confirmed that Aidenvironment indeed has carried out this HCV assessment in this report of which the Public Summary is included and is responsible for the findings and recommendations.

Date: Jakarta, June 6, 2017

Name : Haryono
Title : Landscape Unit, Aidenvironment asia

Annexes 1. CV of PT RSM HCV assessment team members

Haryono

For more than ten years, Haryono has been working on private sector approaches for sustainable development focusing on palm oil sustainability and RSPO standards, include smallholders. His main expertise includes High Conservation Value, High Carbon Stock, Commodities Value Chain Development and Certification, Sustainable Landscape Approach, Livelihoods analysis, and CSR. Haryono registered on ALS HCV resource network as provisional HCV assessor license, since 2015.

Ivan Valentina Agung

Ivan Valentina Ageung graduated in master's degree in law. He has excellent skills on legal drafting, public administration, and litigation. Over the last 15 years, he has been working on agrarian, social-economics political and human rights issues. His skill also on disaster management, community facilitation, mediation and conflict resolution. His recent focused on social impact assessments.

Musfa Dharma

Muzfa Dharma has 20 years of experience in timber and logging companies especially regard with land acquisition and community development. His other expertise is on natural resource management, agriculture and forestry. Muzfa has agronomic background, he has worked on technical assistance as government extension officer for horticulture, subsistence crops and commodities plantation for farmers and farmer groups. His expertise combined forestry-agronomic technical background with extensive work on the agriculture and social development. He now registered as a mediator with the National Mediator Centre, Indonesia in 2015.

Salman

He has been working on legal and corruption issues on forestry and plantation sector. Spatial data analysis is one of his expertise while he always has passion to do field verification. Salman studied Forest Management at Tanjungpura University Pontianak west Kalimantan. Prior to joining Aidenvironment, he worked previously for local NGOs in Pontianak, West Kalimantan on the Swandiri Institute he works for spatial analysis of the Independent Forestry Monitoring Network (JPIK) project. His current position as GIS and remote sensing specialist within Aidenvironment.

Eka Kurnia Pambudi

His expertise on biodiversity especially on botany. His expertise starts since he active in Sylva Indonesia's forestry student organization 2005. Has been involved and worked as a botanist and ecologist at for several NGO and consultants such as; FFI-IP, MEC (Malaysian environmental consultant), Ecologica and Wetlands Research Institute of Tanjungpura University. Eka Kurnia is currently focus to High Carbon Stock approaches and climate change issues.

Berman Manurung

His expertise on biodiversity especially on ornithology and herpetology. His expertise starts since he active in Sylva Indonesia's birding groups 2005. He has involved in the several bird researches since 2013, Bukit Baka-Raya and Betung Kerihun national park and several FFI project site in Kapuas Hulu West Kalimantan. He is now expanding on the vegetation aspect as ecological attribute of bird species.

Annexes 2. Plant species list in PT RSM concession

No	Species	Family	No	Species	Family
1	<i>Acacia mangium</i>	Fabaceae	46	<i>Dillenia excelsa</i>	Dilleniaceae
2	<i>Aglaia rubiginosa</i>	Meliaceae	47	<i>Dillenia reticulata</i>	Dilleniaceae
